RPC-over-RDMA Version Two
draft-cel-nfsv4-rpcrdma-version-two-00

Abstract

This document specifies an improved protocol for conveying Remote Procedure Call (RPC) messages on physical transports capable of Remote Direct Memory Access (RDMA), based on RPC-over-RDMA Version One.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on October 10, 2016.

1. Introduction

Remote Direct Memory Access (RDMA) [RFC5040] [RFC5041] [IB] is a technique for moving data efficiently between end nodes. By directing data into destination buffers as it is sent on a network, and placing it via direct memory access by hardware, the benefits of faster transfers and reduced host overhead are obtained.

A protocol already exists that enables RPC [RFC5531] messages to be conveyed on RDMA transports. That protocol is RPC-over-RDMA Version One, specified in [I-D.ietf-nfsv4-rfc5666bis]. RPC-over-RDMA Version One is deployed and in use, though there are some shortcomings to this protocol, such as:

- The use of small Receive buffers force the use of RDMA Read and Write transfers for small payloads, and limit the size of backchannel messages
- Lack of support for potential optimizations, such as remote invalidation, that require changes to on-the-wire behavior
To address these issues in a way that is compatible with existing
RPC-over-RDMA Version One deployments, a new version of RPC-over-RDMA
is presented in this document. RPC-over-RDMA Version Two contains
only incremental changes over RPC-over-RDMA Version One to facilitate
adoption of Version Two by existing Version One implementations.

The major new feature in RPC-over-RDMA Version Two is extensibility
of the RPC-over-RDMA header. Extensibility enables narrow changes to
RPC-over-RDMA Version Two so that new optional capabilities can be
introduced without a protocol version change and while maintaining
interoperability with existing implementations. New capabilities can
be proposed and developed independently of each other, and
implementers can choose among them. It should be straightforward
to create and document experimental features and then bring them
through the standards process.

In addition to extensibility, the default inline threshold value is
larger in RPC-over-RDMA Version Two. This change is driven by the
increase in average size of RPC messages containing common NFS
operations. With NFSv4.1 [RFC5661] and later, compound operations
convey more data per RPC message. The default 1KB inline threshold
in RPC-over-RDMA Version One prevents attaining the best possible
performance.

1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
document are to be interpreted as described in [RFC2119].

2. Inline Threshold

2.1. Terminology

The term "inline threshold" is defined in Section 4 of
[I-D.ietf-nfsv4-rfc5666bis]. A receiver’s "inline threshold" value
is the largest message size (in octets) that the receiver can accept
via an RDMA Receive operation. Each connection has two inline
threshold values, one for each peer receiver. Inline threshold
values are not advertised to peers via the base RPC-over-RDMA Version
Two protocol.

A connection’s inline threshold determines when full RDMA Read or
Write operations are required because the RPC message to be send is
larger than the peer’s Receive buffer. If an RPC message does not
contain DDP-eligible data items, a requester prepares a Long Call or
Reply to convey the whole RPC message using an RDMA Read or Write.
2.2. Motivation

RDMA Read and Write operations require that each data payload resides in a region of memory that is registered with the RNIC. When an RPC is complete, that region is unregistered, fencing it from the responder.

Both registration and unregistration have a latency cost which is insignificant compared to data handling costs. When a data payload is small, however, the cost of registering and unregistering the memory where it resides becomes a relatively significant part of total RPC latency. Therefore the most efficient operation of RPC-over-RDMA occurs when RDMA Read and Write operations are used for large payloads, and avoided for small payloads.

When RPC-over-RDMA Version One was conceived, the typical size of RPC messages that did not involve a significant data payload was under 500 bytes. A 1024-byte inline threshold adequately minimized the frequency of inefficient Long Calls and Replies.

Starting with NFSv4.1 [RFC5661], NFS COMPOUND RPC messages are larger and more complex than before. With a 1024-byte inline threshold, RDMA Read or Write operations are needed for frequent operations that do not bear a data payload, such as GETATTR and LOOKUP, reducing the efficiency of the transport. To reduce the need to use Long Calls and Replies, RPC-over-RDMA Version Two quadruples the default inline threshold size. This also increases the maximum size of backward direction RPC messages.

2.3. Default Values

RPC-over-RDMA Version Two receiver implementations MUST support an inline threshold of 4096 bytes, but MAY support larger inline threshold values. A mechanism for discovering a peer’s preferred inline threshold value may be used to optimize RDMA Send operations further. In the absence of such a mechanism, senders MUST assume a receiver’s inline threshold is 4096 bytes.

The new default inline threshold size is no larger than the size of a hardware page on typical platforms. This conserves the resources needed to Send and Receive base level RPC-over-RDMA Version Two messages, enabling RPC-over-RDMA Version Two to be used on a broad base of hardware.
3. Protocol Extensibility

The core RPC-over-RDMA Version Two header format is specified in Section 4 as a complete and stand-alone piece of XDR. Any change to this XDR description requires a protocol version number change.

3.1. Optional Features

RPC-over-RDMA Version Two introduces the ability to extend the core protocol via optional features. Extensibility enables minor protocol issues to be addressed and incremental enhancements to be made without the need to change the protocol version. The key capability is that both sides can detect whether a feature is supported by their peer or not. With this ability, OPTIONAL features can be introduced over time to an otherwise stable protocol.

The rdma_opttype field carries a 32-bit unsigned integer. The value in this field denotes an optional operation that MAY be supported by the receiver. The values of this field and their meaning are defined in other Standards Track documents.

The rdma_optinfo field carries opaque data. The content of this field is data meaningful to the optional operation denoted by the value in rdma_opttype. The content of this field is not defined in the base RPC-over-RDMA Version Two protocol, but is defined in other Standards Track documents.

When an implementation does not recognize or support the value contained in the rdma_opttype field, it MUST send an RPC-over-RDMA message with the rdma_xid field set to the same value as the erroneous message, the rdma_proc field set to RDMA_ERROR, and the rdma_err field set to RDMA_ERRINVAL_OPTION.

3.2. Documentation Requirements

RPC-over-RDMA Version Two may be extended by defining a new rdma_opttype value and XDR description of the corresponding rdma_optinfo content.

A set of such new protocol elements may be introduced by a Standards Track document and are together considered an OPTIONAL feature. nsfv4 Working Group and IESG review, together with appropriate testing of prototype implementations, should ensure continued interoperability with existing implementations.

Documents describing extensions to RPC-over-RDMA Version Two should contain:
4. XDR Protocol Definition

This section contains a description of the core features of the RPC-over-RDMA Version Two protocol, expressed in the XDR language [RFC4506].

This description is provided in a way that makes it simple to extract into ready-to-compile form. The reader can apply the following shell script to this document to produce a machine-readable XDR description of the RPC-over-RDMA Version One protocol without any OPTIONAL extensions.

<CODE BEGINS>
#!/bin/sh
grep "^ */\*" | sed 's/\* */ */ ?\*/' | sed 's/\* */ */$?/*'
<CODE ENDS>

That is, if the above script is stored in a file called "extract.sh" and this document is in a file called "spec.txt" then the reader can do the following to extract an XDR description file:
Optional extensions to RPC-over-RDMA Version Two, published as Standards Track documents, will have similar means of providing XDR that describes those extensions. Once XDR for all desired extensions is also extracted, it can be appended to the XDR description file extracted from this document to produce a consolidated XDR description file reflecting all extensions selected for an RPC-over-RDMA implementation.

4.1. Code Component License

Code components extracted from this document must include the following license text. When the extracted XDR code is combined with other complementary XDR code which itself has an identical license, only a single copy of the license text need be preserved.

4.2. RPC-Over-RDMA Version Two XDR

The XDR defined in this section is used to encode the Transport Header Stream in each RPC-over-RDMA Version Two message. The terms "Transport Header Stream" and "RPC Payload Stream" are defined in Section 4 of [I-D.ietf-nfsv4-rfc5666bis].

```c
/// struct rpcrdma2_segment {
///     uint32 rdma_handle;
///     uint32 rdma_length;
///     uint64 rdma_offset;
/// };
///
/// struct rpcrdma2_read_segment {
///     uint32 rdma_position;
///     struct rpcrdma2_segment rdma_target;
/// }
///
/// struct rpcrdma2_read_list {
///     struct rpcrdma2_read_segment rdma_entry;
///     struct rpcrdma2_read_list *rdma_next;
/// }
///
/// struct rpcrdma2_write_chunk {
///     struct rpcrdma2_segment rdma_target<>
/// }
///
/// struct rpcrdma2_write_list {
///     struct rpcrdma2_write_chunk rdma_entry;
///     struct rpcrdma2_write_list *rdma_next;
/// }
///
/// struct rpcrdma2_chunk_lists {
///     struct rpcrdma2_read_list *rdma_reads;
///     struct rpcrdma2_write_list *rdma_writes;
///     struct rpcrdma2_write_chunk *rdma_reply;
/// }
///
/// enum rpcrdma2_errcode {
///     RDMA_ERR_VERS = 1,
///     RDMA_ERR_BAD_HEADER = 2,
///     RDMA_ERR_INVAL_OPTION = 3
/// };
///
/// struct rpcrdma2_err_vers {
```
///     uint32 rdma_vers_low;
///     uint32 rdma_vers_high;
/// };}
/// union rprcdma2_error switch (rprcdma2_errcode rdma_err) {
///     case RDMA_ERR_VERS:
///       rprcdma2_err_vers rdma_vrange;
///     case RDMA_ERR_BAD_HEADER:
///       void;
///     case RDMA_ERR_INVAL_OPTION:
///       void;
/// };}
/// struct rprcdma2_optional {
///     uint32 rdma_opttype;
///     opaque rdma_optinfo<>;
/// };}
/// enum rprcdma2_proc {
///     RDMA_MSG = 0,
///     RDMA_NOMSG = 1,
///     RDMA_MSGP = 2, /* Reserved */
///     RDMA_DONE = 3, /* Reserved */
///     RDMA_ERROR = 4,
///     RDMA_OPTIONAL = 5
/// };}
/// union rprcdma2_body switch (rprcdma2_proc rdma_proc) {
///     case RDMA_MSG:
///       rprcdma2_chunks rdma_chunks;
///     case RDMA_NOMSG:
///       rprcdma2_chunks rdma_chunks;
///     case RDMA_MSGP:
///       void;
///     case RDMA_DONE:
///       void;
///     case RDMA_ERROR:
///       rprcdma2_error rdma_error;
///     case RDMA_OPTIONAL:
///       rprcdma2 Optional rdma_optional;
/// };}
/// struct rprcdma2_xprt_hdr {
///     uint32 rdma_xid;
///     uint32 rdma_vers;
///     uint32 rdma_credit;
///     rprcdma2_body rdma_body;
/// };
When the rdma_proc field has the value RDMA_MSG, an RPC Payload Stream MUST follow the Transport Header Stream in the Send buffer.
When the rdma_proc field has the value RDMA_OPTIONAL, an RPC Payload Stream MAY follow the Transport header Stream in the Send buffer.
When the rdma_proc field has any other value, an RPC Payload Stream MUST NOT follow the Transport Header Stream.

Implementations of RPC-over-RDMA Version Two are REQUIRED to support backwards direction operation as described in [I-D.ietf-nfsv4-rpcrdma-bidirection].

Error handling works the same way in RPC-over-RDMA Version Two as it does in RPC-over-RDMA Version One, with one change described in Section 3.1. Version One error handling is described in Section 5 of [I-D.ietf-nfsv4-rfc5666bis].

5. Protocol Version Negotiation

When an RPC-over-RDMA Version Two requester establishes a connection to a responder, the first order of business is to determine the responder’s highest supported protocol version.

As with RPC-over-RDMA Version One, a requester MUST assume the ability to exchange only a single RPC-over-RDMA message at a time until it receives a non-error RPC-over-RDMA message from the responder that reports the responder’s actual credit limit.

First, the requester sends a single valid RPC-over-RDMA message with the value two (2) in the rdma_vers field. Because the responder might support only RPC-over-RDMA Version One, this initial message can be no larger than the Version One default inline threshold of 1024 bytes.

5.1. Responder Does Support RPC-over-RDMA Version Two

If the responder does support RPC-over-RDMA Version Two, it sends an RPC-over-RDMA message back to the requester with the same XID containing a valid non-error response. Subsequently, both peers use the default inline threshold value for RPC-over-RDMA Version Two connections (4096 bytes).
5.2. Responder Does Not Support RPC-over-RDMA Version Two

If the responder does not support RPC-over-RDMA Version Two, [I-D.ietf-nfsv4-rfc5666bis] REQUIRES that it send an RPC-over-RDMA message to the requester with the same XID, with RDMA_ERROR in the rdma_proc field, and with the error code RDMA_ERR_VERS. This message also reports a range of protocol versions that the responder supports. To continue operation, the requester selects a protocol version in the range of responder-supported versions for subsequent messages on this connection.

If the connection is lost immediately after the RDMA_ERROR reply is received, a requester can avoid a possible version negotiation loop when re-establishing another connection by assuming that particular responder does not support RPC-over-RDMA Version Two. A requester can assume the same situation (no responder support for RPC-over-RDMA Version Two) if the initial negotiation message is lost or dropped.

Once the negotiation exchange is complete, both peers use the default inline threshold value for the protocol version that will be used for the remainder of the connection lifetime. To permit inline threshold values to change during negotiation of protocol version, RPC-over-RDMA Version Two implementations MUST allow inline threshold values to change without triggering a connection loss.

5.3. Requester Does Not Support RPC-over-RDMA Version Two

[I-D.ietf-nfsv4-rfc5666bis] REQUIRES that a responder MUST send Replies with the same RPC-over-RDMA protocol version that the requester uses to send its Calls.

6. Security Considerations

The security considerations for RPC-over-RDMA Version Two are the same as those for RPC-over-RDMA Version One.

7. IANA Considerations

There are no IANA considerations at this time.

8. Acknowledgments

The authors gratefully acknowledge the work of Brent Callaghan and Tom Talpey on the original RPC-over-RDMA Version One specification [RFC5666]. The authors also wish to thank Bill Baker, Greg Marsden, and Matt Benjamin for their support of this work.
The extract.sh shell script and formatting conventions were first described by the authors of the NFSv4.1 XDR specification [RFC5662].

Special thanks go to nfsv4 Working Group Chair Spencer Shepler and nfsv4 Working Group Secretary Thomas Haynes for their support.
