I2NSF Capability Yang Model
`draft-hares-i2nsf-capability-yang-01.txt`

Abstract

This document defines a yang model that enables a I2NSF controller to control various network security functions in Network security devices.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 8, 2017.

1. Introduction

[I-D.ietf-i2nsf-problem-and-use-cases] proposes two different types of interfaces:

- o North-bound interface (NBI) provided by the network security functions (NSFs)
- o Interface between I2NSF user/client with network controller:

This document provides a yang models that define the capabilities for security devices that can be utilized by I2NSF NBI between the I2RS network controller and the NSF devices to express the NSF devices capabilities. It can also be used by the IN2SF user application (or I2NSF client) to network controller to provide a complete list of the I2NSF capabilities the Network controller can control.

This document defines a yang data models based on the [I-D.xia-i2nsf-capability-interface-im], and initial work done in [I-D.xia-i2nsf-service-interface-dm]. Terms used in document are defined in [I-D.ietf-i2nsf-terminology].

This model is an attempt to merge draft-jeong-i2nsf-capability-interface-yang-02.txt, but it has not been reviewed by this draft's authors. Hopefully, this is a good start for a merge. The Yang

module has not been changed to match the high-level-yang. This seemed prudent until we agreed upon the merge.

[I-D.xia-i2nsf-capability-interface-im] defines the following type of functionality in NSFs.

- o network security control
- o content security control, and
- o attack mitigation control

This document contains high-level yang for each type of control. The features in each section have been built up from the following sources:

open-source: firewalls, IDS, IPS. This includes ECA policy for

basic-firewalls: in router, switches, firewalls,
firewall products commercial level
specialized devices IDS, IPS

2. High-level Yang

This section provides an overview of the high level yang.

2.1. capability per NSF

The high level yang capabilities per NSF device, controller, or application is the following:

```
ietf-i2nsf-capability
  +-rw nsf-capabilities
    +-rw capability* [name]
      +-rw nsf-name string
      +-rw cfg-net-seccctl-capabilities
        | uses pkt-eca-policy:pkt-eca-policy-set
      +-rw cfg-net-sec-content-capabilities
        | uses i2nsf-content-caps
        | uses i2nsf-content-sec-actions
        +-rw cfg-attack-mitigate-capabilities*
          | uses i2nsf-mitigate-caps
        +-rw ITResource [ITresource-name]
          | uses cfg-ITResources
```

Figure 1

Each of these section mirror sections in:

[I-D.xia-i2nsf-capability-interface-im]. The high level yang for cfg-net-secctl-capabilities, cfg-net-sec-content-capabilities, and cfg-attack-mitigate-capabilities. This draft is also utilizes the concepts originated in Basile, Lioy, Pitscheider, and Zhao[2015] concerning conflict resolution, use of external data, and ITResources. The authors are grateful to Cataldo for pointing out this excellent work.

2.2. Network Security Control

This section defines the network security control capabilites for each NSF entity (device, controller, APP). The portion of the top level model that this explains is the following:

```
+--rw cfg-net-secctl-capabilities
|  uses pkt-eca-policy:pkt-eca-policy-set
```

Note that yang simply uses the ietf-pkt-eca-policy-cfg from [I-D.ietf-i2rs-pkt-eca-data-model].

```
module ietf-pkt-eca-policy
  +-rw pkt-eca-policy-cfg
    +-rw pkt-eca-policy-set
      +-rw policies* [policy-name]
        +-rw policy-name string
        +-rw vrf-name string
        +-rw address-family
        +-rw rule-list* [rule-name]
          +-rw rule-name
          +-rw rule-order-id uint16
          +-rw default-action-id integer
          +-rw default-resolution-strategy-id integer
      +-rw rules* [order-id rule-name]
        +-rw order-id uint16
        +-rw rule-name string
        +-rw policy-name string
        +-rw cfg-rule-conditions [rule-cnd-id]
          +-rw rule-cnd-id uint32
          +-rw support
            +-rw event-matches boolean
            +-rw pkt-matches boolean
            +-rw usr-context-matches boolean
          +-rw eca-events-match* [rule-event-id]
            +-rw rule-event-it uint16
            | ... time-event match (see below)
          +-rw eca-condition-match
```

```
    |   |   +-rw eca-pkt-matches* [pkt-match-id]
    |   |   | ... (see packet matches below)
    |   |   | ... (address, packet header, packet payload)
    |   |   +-rw eca-user-context-matches* [usr-match-id]
    |   |   | ... (see user context match below)
    +-rw cfg-rule-actions [cfg-action-id]
        +-rw cfg-action-id
        +-rw eca-actions* [action-id]
            +-rw action-id uint32
            +-rw eca-ingress-actions*
                | ... (permit, deny, mirror)
            +-rw eca-fwd-actions*
                | ... (invoke, tunnel encap, fwd)
            +-rw eca-egress-actions*
                | ...
            +-rw eca-qos-actions*
                | ...
            +-rw eca-security-actions*

```

```
| | | | | +--rw tracert-attack-support boolean  
| | | | | +--rw tracert-attack-fcn string
```

figure 4

2.5. IT Resources linked to Capabilities

This section provides a link between capabilities and IT resources. This section has a list of IT Resources by name. Additional input is needed.

```
+--rw cfg-ITResources  
| +--ITResources* [ITresource-name]  
| | +--rw ITresource-name string  
| | ..
```

2.6. actions

The following notifications indicate when rules are added or deleted.

(to be completed after discussion with Paul Jeong, Jin-Yong Kim, and Dae-Young Hyun, and Jung-Soo Park, and Taei-Jin Ahn.)

3. Use of filter-based RIBS

The packet-eca policy is kept for configuration, I2RS ephemeral state, and BGP stored policy state in filter-based RIBS. These RIBS have the high-level yang structures below and are described in [I-D.ietf-i2rs-fb-rib-data-model]. These filter-ribs may be leveraged in I2NSF storage devices for the policy storage.

```

+--rw fb-ribs
  +-rw fb-rib* [rib-name]
    +-rw rib-name string
    |  rw fb-type identityref /config, i2rs, bgp
    +-rw rib-afi rt:address-family
    +-rw fb-rib-intf* [name]
      +-rw name string
      +-rw intf if:interface
    +-rw default-ribs
      +-rw rt-rib string          // routing kernel rib
      +-rw config-rib string;    // static rt-rib
      +-rw i2rs-rib string;     // ephemeral rt-rib
      +-rw bgp-instance-name string // bgp instance
      +-rw bgp-rib string        // bgp rib
    +-rw fb-rib-refs
      +-rw fb-rib-update-ref uint32 //count of writes
    +-rw mounts-using*
      +-rw mount-name string      //
+-use pkt-eca:pkt-eca-policy-set

```

figure 5

4. YANG Modules

```
