Abstract

This document defines a data model to support the Filter-based Routing Information Base (RIB) Yang data models for I2RS. A routing system uses the Filter-based RIB to program FIB entries that process incoming packets by matching on multiple fields within the packet and then performing a specified action on it. The FB-RIB can also specify an action to forward the packet according to the FIB entries programmed using the RIBs of its routing instance.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 22, 2016.
1. Introduction

The Interface to the Routing System (I2RS) [I-D.ietf-i2rs-architecture] architecture provides dynamic read and write access to the information and state within the routing elements. The I2RS client interacts with the I2RS agent in one or more network routing systems.

This document provides a yang module for the I2RS filter Based Routing Information Base (FB-RIB) and describes the I2RS interaction with routing filters within a routing element. The informational model for the FB-RIB is in [I-D.kini-i2rs-fb-rib-info-model]
1.1. Definition of I2RS Filter Based RIB

Filter-based routing is a technique used to make packet forwarding decisions based on a filter that is matched to the incoming packets and the specified action. It should be noted that this is distinct from the static routes in the RIB [I-D.ietf-i2rs-rib-info-model] where the routing is destination address based.

A Filter-Based RIB (Routing Information Base) is contained in a routing instance (defined in [I-D.ietf-i2rs-rib-info-model]). It contains a list of filters (match-action conditions) and a list of interfaces the filter-based forwarding operates on, and default RIB(s).

A Filter Based RIB uses packet forwarding policy. If packet reception is considered an event, then the I2RS Filter-based RIB uses a minimalistic Event-matchCondition-Action policy with the following characteristics:

- **event** = packet/frame received,
- **match condition** - match on field in frame/packet or circumstances relating to packet reception (e.g. time received),
- **action** - modify packet and forward/drop packet.

A Filter-based RIB entry specifies match filters for the fields in a packet (which may include layer 1 to layer 3 header fields, transport or application fields) or size of the packet or interface received on. The matches are contained in an ordered list of filters which contain pairs of match condition-action (aka event-condition-action).

If all matches fail, default action is to forward the packet using Destination Based forward from the default RIB(s). The default RIBs can be:

- created by the I2RS Routing Informational Base (RIB) manager using the yang model described in: in [I-D.ietf-i2rs-rib-info-model], or
- configured RIB created using static routes or [I-D.ietf-netmod-routing-cfg].
- or static RIB created via static route yang model

Actions in the condition-action pair may impact forwarding or set something in the packet that will impact forwarding. Policy actions
are typically applied before applying QoS constraints since policy actions may override QoS constraint.

The Filter-Based RIB resides in ephemeral state as does the I2RS RIB and I2RS topology models.

2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

In this document, these words will appear with that interpretation only when in ALL CAPS. Lower case uses of these words are not to be interpreted as carrying RFC-2119 significance.

3. Definitions and Acronyms

CLI

Command Line Interface

FB-RIB

Filter-Based Routing Information Base

FB-Route

The policy rules in the filter-based RIB are prescriptive of the Event-Condition-Action form which is often represented by if Condition then action

Policy Group

Policy Groups are groups of policy rules. The groups of policy in the basic network policy [I-D.hares-i2rs-pkt-eca-data-model] allow grouping of policy by name. This structure allow easier management of customer-based or provider based filters, but does not change the policy-rules list.

RIB IM

RIB Informational Model (RIB IM) [I-D.ietf-i2rs-rib-info-model]

Routing instance

A routing instance, in the context of the FB-FIB is a collection of RIBs, interfaces, and routing parameters. A routing instance
creates a logical slice of the router and allows different logical slices; across a set of routers; to communicate with each other.

4. High level Yang structure for the FB-RIB

There are three levels in the Filter-Based RIB (FB-RIB) structure:

- a global FB-RIB structures,
- the common structure of the FB-RIB, and
- the groupings that make up the FB-RIB

All structures have two types: configuration/ephemeral state and operational state.

This yang model describes three types of FB-RIBS: configuration, I2RS, and BGP Flow Specification. The configuration FB-RIB yang module is config state ("config true" and "ephemeral false") and survives a reboot. The I2RS FB-RIB yang model is reboot ephemeral ("config true" and "ephemeral true;"). The BGP Flow Specification Filter-Based RIB stores policy which is received by the BGP peers. The BGP configuration contains a flow-specification as part of its configuration, and the ability to export this flow specification to other BGP peers. The BGP local configuration with the flow specification is consider ("config true"), and it is possible to be ephemeral ("ephemeral true") or local configuration ("ephemeral false"). The BGP flow specifications received from peers are derived state, just like other BGP derived state.
Configuration RIBS

```
+-----------------------------------------+
|     routing instance                    |
+-------|-------------|----------------|--+
|             |                |                |
|             |                |                |
+---------|----+  +-----|-----+ +--------|-----+
|config-fb-rib |  |i2rs-fb-rib| |bgp-fs-fb-rib |
+------|-------+  +-----|-----+ +------|-------+
|............:....|...............|     
|fb-ribs*     |             |     
|             |             |     
+--|----------+     
|             |     
```

Figure 3: Routing instance with three types of Filter-FIB lists

The following section provides the high level yang structure diagrams for the following levels of structures for both config/ephemeral state and operationa.

- fb-rib - that contains the structures for the filter-based grouping
- fb-rib-types - that contains the structures for groupings within the filter-based RIBS

These structures are contained within the yang section in this draft.

The packet-reception ECA policy yang module is contained in the draft [I-D.hares-i2rs-pkt-eca-data-model].

For those who desire more information regarding the logic behind the I2RS Filter-Based RIB, please see the Informational Model at: [I-D.kini-i2rs-fb-rib-info-model].
4.1. Top Level Yang Structure for ietf-fb-rib

The Top-level Yang structure for a global FB-RIB types (similar to acl) is not defined for filter-based RIBS. The I2RS Filter-Based RIB should be defined under this structure under a routing instance. The three things under this RIB would be: configured Filter-Based RIB (aka Policy routing), I2RS reboot Ephemeral Filter-Based RIB, and BGP Flow Specification’s Filter-Based RIB. All of these RIBs have similar actions.

There are two types top-level structures for ietf-fb-ribs: config and operational state.

The Top-level Yang structure for a global configuration of Filter-Based RIBs are:

Augments rt:logical-network-elements:
    :logical-network-element:network-instances: 
        network-instance

ietf-fb-rib module
+--rw ietf-fb-rib
    +--rw default-instance-name string
    +--rw default-router-id rt:router-id
    +--rw config-fb-ribs
        if-feature "config-filter-based-RIB";
        uses fb-ribs;
    +--rw i2rs-fb-ribs
        if-feature "I2RS-filter-based-RIB";
        uses fb-ribs-t:fb-ribs;
    +--rw bgp-fs-fb-ribs
        if-feature "BGP-FS-filter-based-RIB";
        uses fb-ribs-t:fb-ribs;

Figure 5: configuration state

The Top-level Yang structure for a global operational state of Filter-Based RIBs are:
Augments rt:logical-network-elements:
  :logical-network-element:network-instances: 
  network-instance

ietf-fb-rib module
  +--rw ietf-fb-rib-opstate
    +--rw default-instance-name string
    +--rw default-router-id rt:router-id
      +--rw config-fb-rib-opstate
        if-feature "config-filter-based-RIB";
        uses fb-rib-t:fb-ribs-oper-status;
      +--rw i2rs-fb-rib-opstate {
        if-feature "I2RS-filter-based-RIB";
        uses fb-rib-t:fb-ribs-oper-status;
      }  
      +--rw bgp-fs-fb-rib-opstate
        if-feature "BGP-FS-filter-based-RIB";
        uses fb-rib-t:fb-ribs-oper-status;

Figure 5: operational state

4.2. Filter-Based RIB structures

The Top-level yang structures at the Filter-Based RIB level have two types: configuration and operational state.

The Top-level Yang structure for the FB-RIB types is:
module: fb-rib-types:
  +--rw fb-ribs
  +--rw fb-rib* [rib-name]
    +--rw rib-name string
    |  rw fb-type identityref / ephemeral or not
    +--rw rib-afi rt:address-family
    +--rw fb-rib-intf* [name]
      +--rw name string
      +--rw intf if:interface
  +--rw default-rib
    +--rw rt-rib rt:routing:routing-instance:name
    +--rw config-rib string; // config rib name
    +--rw i2rs-rib rt:routing-instance:name
    +--rw i2rs-rib string; // ephemeral rib name
    +--rw bgp-instance-name string
    +--rw bgp-rib string // session ephemeral
  +--rw fb-rib-refs
    +--rw fb-rib-update-ref uint32 / count of writes
    +--rw instance-using*
      device:networking-instance:networking-instance-name
  +--use pkt-eca:pkt-eca-policy-set

Figure 6: FB RIB Type Structure

High Level Yang

6. IANA Considerations

TBD

7. Security Considerations

A I2RS RIB is ephemeral data store that will dynamically change traffic paths set by the routing configuration. An I2RS FB-RIB provides dynamic Event-Condition-Action policy that will further change the operation of forwarding by allowing dynamic policy and ephemeral RIBs to alter the traffic paths set by routing configuration. Care must be taken in deployments to use the appropriate security and operational control to make use of the tools the I2RS RIB and I2RS FB-RIB provide.
