A Yang model for I2RS service topology

draft-hares-i2rs-service-topo-dm-01.txt

Abstract

This document defines I2RS protocol-independent service layer virtual topology data model. This data model utilizes the concepts in the generic I2RS topology model of virtual networks (node, links, termination points) and cross-layer topologies. This virtual service topology may be a composite layer created from the combination of protocol-dependent service layers. Protocol-dependent services layers include: L3VPN, L2VPN, EVPN, E-Tree, and others.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on July 6, 2016.

1. Introduction

Service topology in [I-D.ietf-i2rs-yang-network-topo] includes the a virtual topology for a service layer above the L1, L2, and L3 layers. This virtual topology has the generic topology elements of node, link, and terminating point. The virtual service topology is a network-wide topology stored on one routing system which an I2RS agent is connected to.

The virtual service topology is a composite of the available services topologies IETF has standard virtual network topologies for L3VPN, L2VPN, and EVPN services, E-TREE services, Seamless MPLS topologies within an As and others. This yang module provides the composite protocol independent service topology that these protocol dependent topologies plug into

1.1. Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC2119 [RFC2119].

1.2. Base Model: the Service-Topology Component

The following diagram contains an informal graphical depiction of the main elements of the information model:
2. High level Yang architecture

This section describes the Yang High level architecture.

2.1. Network level

The service topology network level defines the following high-level yang architecture:

```yang
module: i2rs-service-topologies
  augment /nw:network/nw:network-types:
    |--rw service-topologies-types
  augment /nw:network:
    |--rw service-topology-attributes
      |--rw name? string
      |--rw flag flag_type;
      |--rw composite-flag identity-ref
      |--rw service-tope-id network-id
      |--rw node-count uint32
      |--rw composite-flag-status identity-ref
```

The service topology attributes for a network include the following

name - name of the service topology,
flag - generic topology flag,
composite-flags - bit mask with flags of service layer topologies
network topology node available to create service topology from. These topologies include: L3VPN, L2VPN, and EVPN services, E-TREE services, Seamless MPLS topologies within an AS and others.

service-topo-id - service topology identifier.

node-count - count of nodes in composite service topology,

composite-flag_status - status flag for each of the composite topologies on whether portions of the topology are included in the composite.

2.2. Node level

module: i2rs-service-topologies

....
 augment /nw:network/nw:node
   +--rw node-service-attributes
      +--rw name? inet:domain-name
      +--rw composite_flag* identityref;
      +--rw service-node-id uint32
      +--rw node-svc_status* identityref;

The additional fields in the service attributes are the following:

name - name of network node,

flag - generic topology node flag,

service-node-id - the id for the service node in the composite network,

node-svc-type - the type of service node. The service node can be a member of one of the existing topology type (L3VPN, L2VPN, EVPN, E-TREE, Seamless MPLS, MPLS-TE, MPLS node, or I2RS created).

2.3. Service Link and Termination point
The augmentation to the service topology is the service link attributes which include:

- **name** - name of the link,
- **svc-link-type** - the service link type used to create this composite service link.
- **metric** - the metric of the service type

The augmentation to the termination point include the following

- **tp-svc-id** - service id for the termination point,
- **supporting termination point** - with a) references to the service network id, node id and termination point for service id, or b) an ip address, or c) an unnumbered link address
