A Yang model for I2RS service topology
draft-hares-i2rs-service-topo-dm-05.txt

Abstract

This document defines I2RS protocol-independent service layer virtual topology data model. This data model utilizes the concepts in the generic I2RS topology model of virtual networks (node, links, termination points) and cross-layer topologies. This virtual service topology may be a composite layer created from the combination of protocol-dependent service layers. Protocol-dependent services layers include: L3VPN, L2VPN, EVPN, E-Tree, and others.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on August 13, 2016.

1. Introduction

Service topology in [I-D.ietf-i2rs-yang-network-topo] includes the a virtual topology for a service layer above the L1, L2, and L3 layers. This virtual topology has the generic topology elements of node, link, and terminating point. The virtual service topology is a network-wide topology stored on one routing system which an I2RS agent is connected to.

The virtual service topology is a composite summary of the services available services gathered from the lower layer indications of L3VPN, L2VPN, and EVPN services, E-TREE services, Seamless MPLS topologies within an As and others. This is a "bottoms up" yang module providing composite protocol independent service topology based on these protocol services.

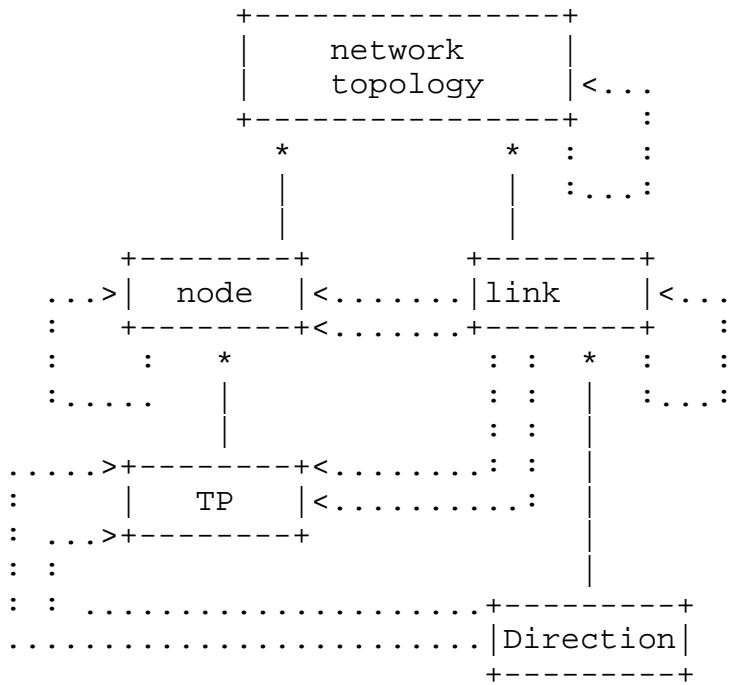

This "bottoms-up" yang model does provide a mechanism to link this bottoms up model to a top-down service model. One example of a top-down service model for L3 VPNs is the L3 Service yang data model [I-D.ietf-l3sm-l3vpn-service-model]. Although the two models are linked, the top-down service model cannot be derived from the lower layers.

1.1. Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC2119 [RFC2119].

1.2. Base Model: the Service-Topology Component

The following diagram contains an informal graphical depiction of the main elements of the information model:

The link between the upper layer and the lower layer occurs by linking the bottoms up service network topologies to Top-down service topologies at certain service nodes to support transport of service across a virtual service link.

For example, the bottoms up topology could contain a composite of 3 L3VPN network topologies, 2 L2VPN network topologies, and 2 EVPN network topologies. Each of these physical networks can support virtual networks on top of the physical network. The service network base bottoms up is formed topology map with all of these topologies.

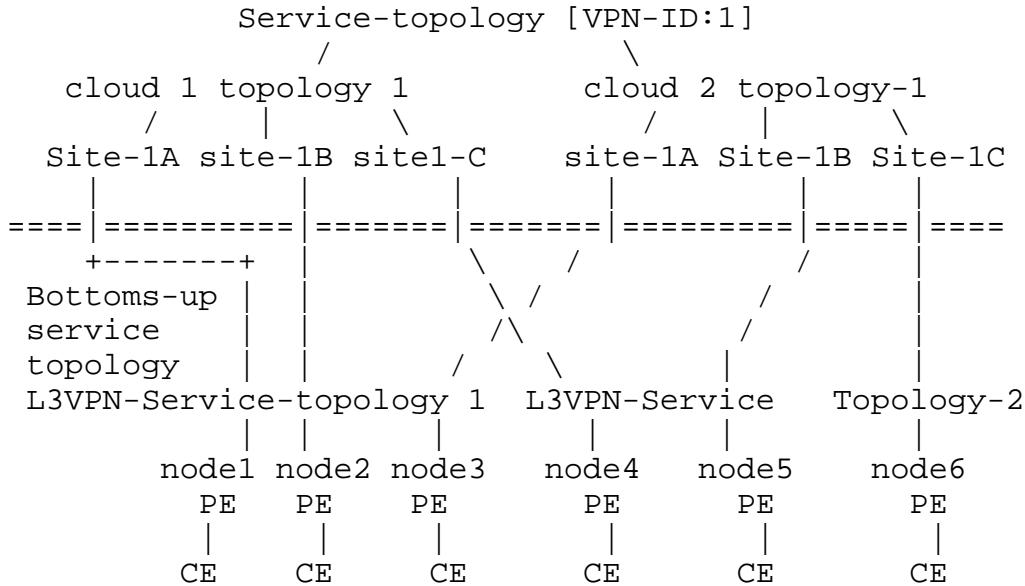

An L3SM might utilize have three VPN services topologies which support three services over 9 virtual topologies transiting the 2 of the L3VPN networks.

- o VPN-svc 1: supporting hub-spoke flow for Customer 1 with 2 Cloud identifiers (2 topologies) with connecting the customers access at 3 sites
- o VPN-svc 2: supporting hub-spoke flow disjoint for Customer 2 with 2 Cloud identifiers (2 topologies) at 3 sites,

- o VPN-svc 3: supporting any-to-any flow for Customer 3 with 1 Cloud Identifier (5 topologies) at 3 sites.

The nodes providing the L3VPN provider equipment (PE) overlap, but the customer equipment (CE) at all sites are unique.

L3SM topologies

These two layers of service topologies are by two different composite models composite models and different supporiting models as follows:

- o Top-Down Provider Services with supporting L3SM model,
- o Bottom-Up I2RS Composite Services with supporting model from L3VPN, L2VPN, EVPN (only L3VPN used). The links between topologies occur at specific nodes.

The links between

2. High level Yang architecture

This section describes the Yang High level architecture.

2.1. Network level

The service topology network level defines the following high-level yang architeture:

```
module: i2rs-service-topologies
  augment /nw:network/nw:network-types:
    +--rw service-topologies-types
  augment /nw:network:
    +--rw service-topology-attributes
      +--rw name?    string
        +--rw flag          flag_type;
        +--rw composite-flag identity-ref
        +--rw c-service-topo-id network-id
        +--rw c-service-id uint32
        +--rw c-node-cnt   uint32
        +--rw composite-flag-status identity-ref
      +--rw supports-td-attributes*
```

Note: Composite flags are bottoms-up flags

The service topology attributes for a network include the following

name - name of the service topology,

flag - generic topology flag,

composite-flags - bit mask with flags of service layer topologies network topology node available to create service topology from. These topologies include: L3VPN, L2VPN, and EVPN services, E-TREE services, Seamless MPLS topologies within an AS and others.

c-service-topo-id - composite service topology id

c-node-count - count of nodes in composite service topology,

composite-flag-status - status flag for each of the composite topologies on whether portions of the topology are included in the composite.

supports-td-attributes - composite topology supports top-down models.

2.2. Node level

```
module: i2rs-service-topologies
....
augment /nw:network/nw:node
    +--rw node-service-attributes
        ---rw c-svc-node-name?    inet:domain-name
        ---rw c-svc-flag*   identityref;
            ---rw c-service-node-id  uint32
            ---rw c-svc-node-type   identityref
            ---rw c-node-svc-status* identityref;
            ---rw c-node-supports-td-attributes
```

The additional fields in the service attributes are the following:

c-svc-node-name - name of network node,

c-svc-flag - composite service topology node flag,

c-service-node-id - the id for the service node in the composite network,

c-node-svc-type - the type of service node. The service node can be a member of one of the existing topology type (L3VPN, L2VPN, EVPN, E-TREE, Seamless MPLS, MPLS-TE, MPLS node, or I2RS created).

c-node-svc-status - specific status of the node giving specific supports for composite supporting nodes such as L3VPN TE links or EVPN hub-spoke,

c-node-supports-td-attribute - top down attributes support such as L3 Attributes (hub-spoke or multicast)

2.3. Service Link and Termination point

```

augment /nw:network/nt:link:
  +-rw service-link-attributes
    +-rw c-svc-link-name?      string
      +-rw c-svc-link-id       uint32
    +-rw c-svc-link-type      identityref
    +-rw c-svc-link-metric?   uint32
      +-rw c-svc-link-attributes* identityref
      +-rw c-svc-link-td-supports-attr* identityref
augment /nw:network/nw:node/nt:termination-point:
  +-rw service-termination-point-attributes
    +-rw tp-svc-id
    +-rw (supporting-termination-point)
      +-:(service)
        |   +-rw service-network-id leafref
        |   +-rw service-node-id   leafref
        |   |   +-rw service-tp-id leafref
        |   +-:(ip)
        |     +-rw ip-address    inet:ip-address
      +-:(unnumbered)
        +-rw unnumbered-id?    uint32

```

The augmentation to the service topology is the service link attributes which include:

name - name of the link,

svc-link-type - the service link type used to create this composite service link.

metric - the metric of the service type

svc-attributes - the composite attributes of link

svc-td-supports - link support of Top-down attributes

The augmentation to the termination point include the following

tp-svc-id - service id for the termination point,

supporting termination point* - with a)references to the service network id, node id and termination point for service id, or b) an ip address, or c) an unnumbered link address
