Abstract

This document proposes a YANG data model for monitoring Network Security Functions (NSFs) in the Interface to Network Security Functions (I2NSF) framework. If the monitoring of NSFs is performed in a comprehensive way, it is possible to detect the indication of malicious activity, anomalous behavior or the potential sign of denial of service attacks in a timely manner. This monitoring functionality is based on the monitoring information that is generated by NSFs. Thus, this document describes not only a data tree to specify an information model for monitoring NSFs, but also the corresponding YANG data model for monitoring NSFs.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on April 25, 2019.
1. Introduction

This document defines a YANG [RFC6020] data model for monitoring Network Security Functions (NSFs). The monitoring means the acquisition of vital information about NSFs via notifications, records or counters. The data model for the monitoring presented in this document is derived from the information model for monitoring NSFs through the NSF-Facing Interface specified in [i2nsf-monitoring-im].

2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].
3. Terminology

This document uses the terminology described in [i2nsf-terminology][i2nsf-framework]. Especially, the following terms are from [i2nsf-monitoring-im].

- Information Model: An information model is a representation of concepts of interest to an environment in a form that is independent of data repository, data definition language, query language, implementation language, and protocol.

- Data Model: A data model is a representation of concepts of interest to an environment in a form that is dependent on data repository, data definition language, query language, implementation language, and protocol.

3.1. Tree Diagrams

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in these diagrams [i2rs-rib-data-model] is as follows:

- Brackets "[" and "]" enclose list keys.

- Abbreviations before data node names: "rw" means configuration (read-write) and "ro" state data (read-only).

- Symbols after data node names: "?" means an optional node and "*" denotes a "list" and "leaf-list".

- Parenttheses enclose choice and case nodes, and case nodes are also configured marked with a colon (":")

- Ellipsis ("...") stands for contents of subtrees that are not shown.

4. NSF Monitoring Management

A standard model for monitoring data is required for the administrator to check the monitoring data generated by NSF. The administrator can check the monitoring data through the following process. When the NSF monitoring data that is under the standard format is generated, the NSF forwards it to the security controller. The security controller delivers it to I2NSF consumer or Developer’s Management System so that the administrator can know the state of the framework. In order to communicate with other component, it requires the interfaces. The three main interfaces in I2NSF framework are used for sending monitoring data like as follows:
I2NSF Consumer-Facing Interface: When an I2NSF user makes a security policy and forwards it to the security controller through the Consumer-Facing Interface, it can specify the threat-feed for threat prevention, the custom list, the malicious code scan group, and the event map group. They can be used as an event to be monitored by NSF.

I2NSF Registration Interface: The NFV architecture provides VNF lifecycle management through the Ve-Vnfm interface. The role of Ve-Vnfm is to request VNF lifecycle management, exchange configuration information, and exchange status information for network service lifecycle management. For I2NSF framework case, the DMS manages data such as resource state and so on for lifecycle of NSF. Therefore the generated monitoring data need to be delivered to Vn-Vnfm via DMS in the environment that can support VNF.

I2NSF NSF-Facing Interface: After the policy is translated by security policy translator in security controller, the translated security policy (low-level) is applied to NSF via NSF-Facing Interface. The monitoring data model specifies the list of event that can trigger the ECA (Event-Condition-Action) policy at NSF-Facing Interface.

5. Information Model Structure

Figure 1 shows the overview of a structure tree of monitoring information based on the [i2nsf-monitoring-im].

6. YANG Data Model

This section introduces a YANG data model for the information model of monitoring information based on [i2nsf-monitoring-im].

```yml
<CODE BEGINS> file "ietf-i2nsf-nsf-monitoring-dm@2018-10-22.yang"
module ietf-i2nsf-nsf-monitoring-dm {
    yang-version 1.1;
    namespace
    prefix monitoring-information;
    import ietf-inet-types{
        prefix inet;
    }
    import ietf-yang-types{
        prefix yang;
    }
    organization
        "IETF I2NSF (Interface to Network Security Functions)"
```
typedef severity {

Appendix A. Changes from draft-hong-i2nsf-nsf-monitoring-data-model-04

The following changes are made from draft-hong-i2nsf-nsf-monitoring-data-model-04:

1. The association with the three main interfaces of the I2NSF framework is described in Section 3.

2. Typos are corrected.
