I2NSF Capability YANG Data Model
draft-ietf-i2nsf-capability-data-model-03

Abstract

This document defines a YANG data model for capabilities of various Network Security Functions (NSFs) in Interface to Network Security Functions (I2NSF) framework to centrally manage capabilities of various NSFs.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 12, 2019.

1. Introduction

As the industry becomes more sophisticated and network devices (e.g., Internet of Things, Self-driving vehicles, and VoIP/VoLTE smartphones), service providers have a lot of problems mentioned in [RFC8192]. To resolve these problems, [i2nsf-nsf-cap-im] specifies the information model of the capabilities of Network Security Functions (NSFs).

This document provides a data model using YANG [RFC6020][RFC7950] that defines the capabilities of NSFs to centrally manage capabilities of those security devices. The security devices can register their own capabilities into Network Operator Management (Mgmt) System (i.e., Security Controller) with this YANG data model through the registration interface [RFC8329]. With the capabilities of those security devices registered centrally, those security devices can be easily managed [RFC8329]. This YANG data model is based on the information model for I2NSF NSF capabilities [i2nsf-nsf-cap-im].
This YANG data model uses an "Event-Condition-Action" (ECA) policy model that is used as the basis for the design of I2NSF Policy described in [RFC8329] and [i2nsf-nsf-cap-im]. Rules. The "ietf-i2nsf-capability" YANG module defined in this document provides the following features:

- Definition for general capabilities of network security functions.
- Definition for event capabilities of generic network security function.
- Definition for condition capabilities of generic network security function.
- Definition for condition capabilities of advanced network security function.
- Definition for action capabilities of generic network security function.
- Definition for resolution strategy capabilities of generic network security function.
- Definition for default action capabilities of generic network security function.

2. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119][RFC8174].

3. Terminology

This document uses the terminology described in [i2nsf-terminology][i2nsf-nsf-cap-im] [RFC8431][supa-policy-info-model]. Especially, the following terms are from [supa-policy-info-model]:

- Data Model: A data model is a representation of concepts of interest to an environment in a form that is dependent on data repository, data definition language, query language, implementation language, and protocol.

- Information Model: An information model is a representation of concepts of interest to an environment in a form that is independent of data repository, data definition language, query language, implementation language, and protocol.
3.1. Tree Diagrams

A simplified graphical representation of the data model is used in this document. The meaning of the symbols in these diagrams [RFC8340] is as follows:

- Brackets "[" and "]" enclose list keys.
- Abbreviations before data node names: "rw" means configuration (read-write) and "ro" state data (read-only).
- Symbols after data node names: "?" means an optional node and "*" denotes a "list" and "leaf-list".
- Parentheses enclose choice and case nodes, and case nodes are also marked with a colon (":").
- Ellipsis ("...") stands for contents of subtrees that are not shown.

4. Overview

This section explains overview how the YANG data model can be used in I2NSF framework described in [RFC8329]. Figure 1 shows capabilities of NSFs in I2NSF Framework. As shown in this figure, Developer’s Mgmt System can register NSFs with capabilities that the network security device can support. To register NSFs in this way, the Developer’s Mgmt System utilizes this standardized capabilities YANG data model through registration interface. With the capabilities of those network security devices registered centrally, those security devices can be easily managed, which can resolve the a lot of problems described in [RFC8192]. The following shows use cases.

Note [i2nsf-nsf-yang] is used to configure security policy rules of generic network security functions and [i2nsf-advanced-nsf-dm] is used to configure security policy rules of advanced network security functions according to the capabilities of network security devices registed in I2NSF Framework.
If network manager wants to apply security policy rules about blocking malicious users, it is a tremendous burden to apply all of these rules to NSFs one by one. This problem can be resolved by managing the capabilities of NSFs. If network manager wants to block malicious users with IPv6, network manager sends the security policy rules about blocking the users to Network Operator Mgmt System using I2NSF user (i.e., a web browser or a software). When the Network Operator Mgmt System receives the security policy rules, it automatically sends that security policy rules to appropriate NSFs (i.e., NSF-m in Developer Mgmt System A and NSF-1 in Developer Mgmt System B) which can support the capabilities (i.e., IPv6). Therefore, I2NSF User need not consider NSFs where to apply the rules.

If NSFs find the malicious packets, it is a tremendous burden for network manager to apply the rule about blocking the malicious packets to NSFs one by one. This problem can be resolved by
managing the capabilities of NSFs. If NSFs find the suspicious packets with IPv4, they can ask the Network Operator Mgmt System for information about the suspicious packets with IPv4. to alter specific rules and/or configurations. When the Network Operator Mgmt System receives information, it inspects the information about the suspicious packets with IPv4. If the suspicious packets are determined to be malicious packets, the Network Operator Mgmt System creates and sends the security policy rule against malicious packets to appropriate NSFs (i.e., NSF-1 in Developer Mgmt System A and NSF-1 and NSF-n in Developer Mgmt System B) which can support the capabilities (i.e., IPv4). Therefore, the new security policy rule against malicious packets can be applied to appropriate NSFs without intervention of humans.

5. YANG Tree Diagram

This section shows an YANG tree diagram of capabilities for network security functions, as defined in the [i2nsf-nsf-cap-im].

5.1. Capabilities of Network Security Function

This section shows YANG tree diagram for capabilities of network security functions.
This YANG tree diagram shows capabilities of network security functions.

The NSF includes NSF capabilities. The NSF capabilities include time capabilities, event capabilities, condition capabilities, action capabilities, resolution strategy capabilities, and default action capabilities.

Time capabilities are used to specify capabilities when to execute the I2NSF policy rule. The time capabilities are defined as absolute time and periodic time.

Event capabilities are used to specify capabilities how to trigger the evaluation of the condition clause of the I2NSF Policy Rule. The event capabilities are defined as system event and system alarm. The event capability can be extended according to specific vendor condition features. The event capability is described in detail in [i2nsf-nsf-cap-im].

Condition capabilities are used to specify capabilities of a set of attributes, features, and/or values that are to be compared with a set of known attributes, features, and/or values in order to determine whether or not the set of actions in that (imperative) I2NSF policy rule can be executed or not. The condition capability is classified as condition capabilities of generic network security functions and advanced network security functions. The condition capabilities of generic network security functions are defined as IPv4 capability, IPv6 capability, tcp capability, udp capability, and icmp capability. The condition capabilities of advanced network security functions are defined as antivirus capability, antiddos capability, ips capability, http capability, and VoIP/VoLTE capability. The condition capability can be extended according to specific vendor condition features. The condition capability is described in detail in [i2nsf-nsf-cap-im].

Action capabilities is used to specify capabilities how to control and monitor aspects of flow-based NSFs when the event and condition clauses are satisfied. The action capabilities are defined as ingress action capability, egress action capability, and log action capability. The action capability can be extended according to specific vendor action features. The action capability is described in detail in [i2nsf-nsf-cap-im].

Resolution strategy capabilities are used to specify capabilities how to resolve conflicts that occur between the actions of the same or different policy rules that are matched and contained in this particular NSF. The resolution strategy capabilities are defined as First Matching Rule (FMR), Last Matching Rule (LMR), Prioritized Matching Rule (PMR) with Errors (PMRE), and Prioritized Matching Rule with No Errors (PMRN). The resolution strategy capability can be extended according to specific vendor action features. The resolution strategy capability is described in detail in [i2nsf-nsf-cap-im].

Default action capabilities are used to specify capabilities how to execute I2NSF policy rule when no rule matches a packet. The default action capabilities are defined as pass, drop, reject, alert, and mirror. The default action capability can be extended according to specific vendor action features. The default action capability is described in detail in [i2nsf-nsf-cap-im].

6. YANG Data Modules
6.1. I2NSF Capability YANG Data Module

This section introduces an YANG data module for capabilities of network security functions, as defined in the [i2nsf-nsf-cap-im].

Treasure

Figure 3: YANG Data Module of I2NSF Capability

7. IANA Considerations

This document requests IANA to register the following URI in the
"IETF XML Registry" [RFC3688]:

Registrant Contact: The IESG.

XML: N/A; the requested URI is an XML namespace.
This document requests IANA to register the following YANG module in the "YANG Module Names" registry [RFC7950].

name: ietf-i2nsf-capability

prefix: iicapa

reference: RFC XXXX

8. Security Considerations

The YANG module specified in this document defines a data schema designed to be accessed through network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the required transport secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the required transport secure transport is TLS [RFC8446].

The NETCONF access control model [RFC8341] provides a means of restricting access to specific NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

Appendix A. Changes from draft-ietf-i2nsf-capability-data-model-02

The following changes are made from draft-ietf-i2nsf-capability-data-model-03:

- We revised this YANG data module according to guidelines for authors and reviewers of YANG data model documents [RFC6087].
- We changed the structure of the overall YANG data module.
- We changed enumeration type to identity type for scalable components.
- We added a description for the YANG tree diagram of the YANG data module.
- We revised overall sentences of this YANG data model document.
- We added configuration examples to make it easier for reviewers to understand.

Appendix B. Acknowledgments

This work was supported by Institute for Information & communications Technology Promotion (IITP) grant funded by the Korea government (MSIP) (No.R-20160222-002755, Cloud based Security Intelligence Technology Development for the Customized Security Service Provisioning).

Appendix C. Contributors

This document is made by the group effort of I2NSF working group. Many people actively contributed to this document. The following are considered co-authors:

- Hyoungshick Kim (Sungkyunkwan University)
- Daeyoung Hyun (Sungkyunkwan University)
- Dongjin Hong (Sungkyunkwan University)
- Liang Xia (Huawei)
- Jung-Soo Park (ETRI)
- Tae-Jin Ahn (Korea Telecom)
- Se-Hui Lee (Korea Telecom)
