SACM Information Model
draft-ietf-sacm-information-model-09

Abstract

This document defines the Information Elements that are transported between SACM components and their interconnected relationships. The primary purpose of the Secure Automation and Continuous Monitoring (SACM) Information Model is to ensure the interoperability of corresponding SACM data models and addresses the use cases defined by SACM. The Information Elements and corresponding types are maintained as the IANA "SACM Information Elements" registry.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at http://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 14, 2017.

1. Introduction

The SACM Information Model (IM) serves multiple purposes:

- to ensure interoperability between SACM data models that are used as transport encodings,
- to provide a standardized set of Information Elements – the SACM Vocabulary – to enable the exchange of content vital to automated security posture assessment, and
- to enable secure information sharing in a scalable and extensible fashion in order to support the tasks conducted by SACM components.

A complete set of requirements imposed on the IM can be found in [I-D.ietf-sacm-requirements]. The SACM IM is intended to be used for standardized data exchange between SACM components (data in motion). Nevertheless, the Information Elements (IE) and their relationships defined in this document can be leveraged to create and align corresponding data models for data at rest.

The information model expresses, for example, target endpoint (TE) attributes, guidance, and evaluation results. The corresponding Information Elements are consumed and produced by SACM components as they carry out tasks.

The primary tasks that this information model supports (on data, control, and management plane) are:

- TE Discovery
- TE Characterization
- TE Classification
- Collection
- Evaluation
- Information Sharing
- SACM Component Discovery
- SACM Component Authentication
- SACM Component Authorization
2. Conventions used in this document

2.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

2.2. Information Element Examples

The notation used to define the SACM Information Elements (IEs) is based on a customized version of the IPFIX information model syntax [RFC7012] which is described in Figure 2. However, there are several examples presented throughout the document that use a simplified pseudo-code to illustrate the basic structure. It should be noted that while they include actual names of subjects and attributes as well as values, they are not intended to influence how corresponding SACM IEs should be defined in Section 7. The examples are provided for demonstration purposes only.

3. Information Elements

The IEs defined in this document comprise the building blocks by which all SACM content is composed. They are consumed and provided by SACM components on the data plane. Every Information Element has a unique label: its name. Every type of IE defined by the SACM IM is registered as a type at the IANA registry. The Integer Index of the IANA SMI number tables can be used by SACM data models.

3.1. Context of Information Elements

The IEs in this information model represent information related to assets in the following areas (based on the use cases described in [RFC7632]):

- Endpoint Management
- Software Inventory Management
- Hardware Inventory Management
- Configuration Management
- Vulnerability Management
3.2. Extensibility of Information Elements

A SACM data model based on this information model MAY include additional information elements that are not defined here. The labels of additional Information Elements included in different SACM data models MUST NOT conflict with the labels of the Information Elements defined by this information model, and the names of additional Information Elements MUST NOT conflict with each other or across multiple data models. In order to avoid naming conflicts, the labels of additional IEs SHOULD be prefixed to avoid collisions across extensions. The prefix MUST include an organizational identifier and therefore, for example, MAY be an IANA enterprise number, a (partial) name space URI, or an organization name abbreviation.

4. Structure of Information Elements

There are two basic types of IEs:

- Attributes: Atomic information elements that are equivalent to name-value-pairs and can be components of Subjects.

- Subjects: Composite information elements that have a name and are made up of Attributes and/or other Subjects. Every IE that is part of a Subject can have a quantity associated with it (e.g. zero-one, none-unbounded). The content IEs of a Subject can be ordered or unordered.

Example Instance of an Attribute:
hostname = "arbutus"

Example Instance of a Subject:
coordinates = (latitude = N27.99619, longitude = E86.92761)

Figure 1: Example instance of an attribute and subject.

In general, every piece of information that enables security posture assessment or further enriches the quality of the assessment process can be associated with metadata. In the SACM IM, metadata is represented by specific subjects and is bundled with other attributes or subjects to provide additional information about them. The IM explicitly defines two kinds of metadata:

- Metadata focusing on the data origin (the SACM component that provides the information to the SACM domain)
Metadata focusing on the data source (the target endpoint that is assessed)

Metadata can also include relationships that refer to other associated IEs (or SACM content in general) by using referencing labels that have to be included in the metadata of the associated IE.

Subjects can be nested and the SACM IM allows for circular or recursive nesting. The association of IEs via nesting results in a tree-like structure wherein subjects compose the root and intermediary nodes and attributes the leaves of the tree. This semantic structure does not impose a specific structure on SACM data models regarding data in motion or data repository schemata for data at rest.

The SACM IM provides two conceptual top-level subjects that are used to ensure a homogeneous structure for SACM content and its associated metadata: SACM statements and SACM content-elements. Every set of IEs that is provided by a SACM component must provide the information contained in these two subjects although it is up to the implementer whether or not the subjects are explicitly defined in a data model.

The notation the SACM IM is defined in is based on a modified version of the IP Information Flow Export (IPFIX) Information Model syntax described in Section 2.1 of [RFC7012]. The customized syntax used by the SACM IM is defined below in Figure 2.

- **elementId (required):** The numeric identifier of the Information Element. It is used for the compact identification of an Information Element. If this identifier is used without an enterpriseID, then the elementId must be unique, and the description of allowed values is administrated by IANA. The value "TBD" may be used during development of the information model until an elementId is assigned by IANA and filled in at publication time.

- **enterpriseId (optional):** Enterprises may wish to define Information Elements without registering them with IANA, for example, for enterprise-internal purposes. For such Information Elements, the elementId is
not sufficient when used outside the enterprise. If specifications of enterprise-specific Information Elements are made public and/or if enterprise-specific identifiers are used by SACM components outside the enterprise, then the enterprise-specific identifier MUST be made globally unique by combining it with an enterprise identifier. Valid values for the enterpriseId are defined by IANA as Structure of Management Information (SMI) network management private enterprise numbers.

name (required): A unique and meaningful name for the Information Element.

dataType (required): There are two kinds of datatypes: simple and structured. Attributes are defined using simple datatypes and subjects are defined using structured datatypes. The contents of the datatype field will be either a reference to one of the simple datatypes listed in Section 5.1, or the specification of structured datatype as defined in Section 5.2.

status (required): The status of the specification of the Information Element. Allowed values are "current" and "deprecated". All newly defined Information Elements have "current" status. The process for moving Information Elements to the "deprecated" status is TBD.

description (required): Describes the meaning of the Information Element, how it is derived, conditions for its use, etc.

structure (optional): A parsable property that provides details about the definition of...
structured Information Elements as described in Section 5.2.

references (optional): Identifies other RFCs or documents outside the IETF which provide additional information or context about the Information Element.

Figure 2: Information Element Specification Template

4.1. Information Element Naming Convention

SACM Information Elements must adhere to the following naming conventions.

- Names SHOULD be descriptive
- Names MUST be unique within the SACM registry. Enterprise-specific names SHOULD be prefixed with a Private Enterprise Number [PEN].
- Names MUST start with lowercase letters unless it begins with a Private Enterprise Number
- Composed names MUST use capital letters for the first letter of each part

4.2. SACM Content Elements

Every piece of information that is provided by a SACM Component is always associated with a set of data source metadata (e.g. the timestamp when the information was collected, the target endpoint from which this set of information is about, etc.) which is provided in the SACM Content Element Metadata. The SACM Content Element is the subject information element that associates the information with the SACM Content Element Metadata. The SACM Content Element Metadata may also include relationships that express associations with other SACM Content Elements.
content-element = (  
    content-metadata = (  
        collection-timestamp = 146193322,  
        data-source = fb02e551-7101-4e68-8dec-1fde6bd10981  
    ),  
    hostname = "arbutus",  
    coordinates = (  
        latitude = N27.99619,  
        longitude = E86.92761  
    )  
)

Figure 3: Example set of IEs associated with a timestamp and a target endpoint label.

4.3. SACM Statements

One or more SACM Content Elements are bundled in a SACM Statement. In contrast to SACM Content Element Metadata, SACM Statement Metadata focuses on the providing information about the SACM Component that provided it rather than the target endpoint that the content is about. The only content-specific metadata included in the SACM Statement is the statement-type IE. Therefore, multiple SACM Content Elements that share the same SACM Statement Metadata and are of the same statement-type can be included in a single SACM Statement. A SACM Statement functions similar to an envelope or a header and is the subject information element that associates SACM Statement Metadata with security automation information provided in its SACM Content Element(s). Its purpose is to enable the tracking of the origin of data inside a SACM domain and more importantly to enable the mitigation of conflicting information that may originate from different SACM Components. How a consuming SACM Component actually deals with conflicting information is out-of-scope of the SACM IM. Semantically, the term statement implies that the SACM content provided by a SACM Component might not be correct in every context, but, rather is the result of a best-effort to produce correct information.
sacm-statement = (
    statement-metadata = ( 
        publish-timestamp = 1461934031, 
        data-origin = 24e67957-3d31-4878-8892-da2b35e121c2, 
        statement-type = observation 
    ),
    content-element = ( 
        content-metadata = ( 
            collection-timestamp = 146193322, 
            data-source = fb02e551-7101-4e68-8dec-1fde6bd10981 
        ),
        hostname = "arbutus"
    )
)

Figure 4: Example of a simple SACM statement including a single content-element.
sacm-statement = (  
    statement-metadata = (  
        publish-timestamp = 1461934031,  
        data-origin = 24e67957-3d31-4878-8892-da2b35e121c2  
        statement-type = observation  
    ),  
    content-element = (  
        content-metadata = (  
            collection-timestamp = 146193322,  
            data-source = fb02e551-7101-4e68-8dec-1fde6bd10981  
        ),  
        coordinates = (  
            latitude = N27.99619,  
            longitude = E86.92761  
        )  
    )  
)

sacm-statement = (  
    statement-metadata = (  
        publish-timestamp = 1461934744,  
        data-origin = e42885a1-0270-44e9-bb5c-865cf6bd4800,  
        statement-type = observation  
    ),  
    content-element = (  
        content-metadata = (  
            collection-timestamp = 146193821,  
            te-label = fb02e551-7101-4e68-8dec-1fde6bd10981  
        ),  
        coordinates = (  
            latitude = N16.67622,  
            longitude = E141.55321  
        )  
    )  
)

Figure 5: Example of conflicting information originating from  
different SACM components.

4.4. Relationships

An IE can be associated with another IE, e.g. a user-name attribute  
can be associated with a content-authorization subject. These  
references are expressed via the relationships subject, which can be  
included in a corresponding content-metadata subject. The  
relationships subject includes a list of one or more references. The  
SACM IM does not enforce a SACM domain to use unique identifiers as
references. Therefore, there are at least two ways to reference another

- The value of a reference represents a specific content-label that is unique in a SACM domain (and has to be included in the corresponding content-element metadata in order to be referenced), or

- The reference is a subject that includes an appropriate number of IEs in order to identify the referenced content-element by its actual content.

It is recommended to provide unique identifiers in a SACM domain and the SACM IM provides a corresponding naming-convention as a reference in Section 4.1. The alternative highlighted above summarizes a valid approach that does not require unique identifiers and is similar to the approach of referencing target endpoints via identifying attributes included in a characterization record.

```
content-element = (  
  content-metadata = (  
    collection-timestamp = 1461934031,  
    te-label = fb02e551-7101-4e68-8dec-1fde6bd10981  
    relationships = (  
      associated-with-user-account = f3d70ef4-7e18-42af-a894-8955ba87c95d  
    )  
  ),  
  hostname = "arbutus"  
)  

content-element = (  
  content-metadata = (  
    content-label = f3d70ef4-7e18-42af-a894-8955ba87c95d  
  ),  
  user-account = (  
    username = romeo  
    authentication = local  
  )  
)  
```

Figure 6: Example instance of a content-element subject associated with another subject via its content metadata.
4.5. Event

Event subjects provide a structure to represent the change of IE values that was detected by a collection task at a specific point of time. It is mandatory to include the new values and the collection timestamp in an event subject and it is recommended to include the past values and a collection timestamp that were replaced by the new IE values. Every event can also be associated with a subject-specific event-timestamp and a lastseen-timestamp that might differ from the corresponding collection-timestamps. If these are omitted the collection-timestamp that is included in the content-metadata subject is used instead.

```
sacm-statement = (
    statement-metadata = (
        publish-timestamp = 1461934031,
        data-origin = 24e67957-3d31-4878-8892-da2b35e121c2,
        statement-type = event
    ),
    event = (  
        event-attributes = (
            event-name = "host-name change",
            content-element = (  
                content-metadata = (  
                    collection-timestamp = 146193322,
                    data-source = fb02e551-7101-4e68-8dec-1fde6bd10981,
                    event-component = past-state
                ),
                hostname = "arbutus"
            ),
            content-element = (  
                content-metadata = (  
                    collection-timestamp = 146195723,
                    data-source = fb02e551-7101-4e68-8dec-1fde6bd10981,
                    event-component = current-state
                ),
                hostname = "lilac"
            )
        )
    )
)
```

Figure 7: Example of a SACM statement containing an event.
4.6. Categories

Categories are special IEs that enable to refer to multiple types of IE via just one name. Therefore, they are similar to a type-choice. A prominent example of a category is when identifying a target endpoint. In some cases, a target endpoint will be identified by a set of identifying attributes and in other cases a target endpoint will be identified by a target endpoint label which is unique within a SACM domain. If a subject includes the targetEndpoint information element as one of its components, any of the category members (targetEndpointIdentifier or targetEndpointLabel) are valid to be used in its place.

5. Abstract Data Types

This section describes the set of valid abstract data types that can be used for the specification of the SACM Information Elements in Section 7. SACM currently supports two classes of datatypes that can be used to define Information Elements.

- Simple: Datatypes that are atomic and are used to define the type of data represented by an attribute Information Element.

- Structured: Datatypes that can be used to define the type of data represented by a subject Information Element.

Note that further abstract data types may be specified by future extensions of the SACM information model.

5.1. Simple Datatypes

5.1.1. IPFIX Datatypes

To facilitate the use of existing work, SACM supports the following abstract data types defined in Section 3 of [RFC7012].

- unsigned8, unsigned16, unsigned32, unsigned64
- signed8, signed16, signed32, signed64
- float32, float64
- boolean
- macAddress
- octetArray
5.2. Structured Datatypes

5.2.1. List Datatypes

SACM defines the following abstract list data types that are used to represent the structured data associated with subjects.

- list: indicates that the Information Element order is not significant but MAY be preserved.
- orderedList: indicates that Information Element order is significant and MUST be preserved.

The notation for defining a SACM structured datatype is based on regular expressions, which are composed of the keywords "list" or "orderedList" and an Information Element expression. IE expressions use some of the regular expression syntax and operators, but the terms in the expression are the names of defined Information Elements instead of character classes. The syntax for defining list and orderedList datatypes is described below, using BNF:

```plaintext
<list-def> -> ("list"|"orderedList") "(" <ie-expression> ")"

<ie-expression> -> <ie-name> <cardinality>?
    ( ("," | ")") <ie-name> <cardinality>?)*

<cardinality> -> "+" | "*" | "?" |
    ( ") <non-neg-int> ("," <non-neg-int>)? ")" )
```

Figure 8: Syntax for Defining List Datatypes

As seen above, multiple occurrences of an Information Element may be present in a structured datatype. The cardinality of an Information Element within a structured Information Element definition is defined by the following operators:
* - zero or more occurrences
+ - one or more occurrences
? - zero or one occurrence
(m,n) - between m and n occurrences

Figure 9: Specifying Cardinality for Structured Datatypes

The absence of a cardinality operator implies one mandatory occurrence of the Information Element.

Below is an example of a structured Information Element definition.

personInfo = list(firstName, middleNames?, lastName)
firstName = string
middleNames = orderedList(middleName+)
middleName = string
lastName = string

As an example, consider the name "John Ronald Reuel Tolkien". Below are instances of this name, structured according to the personInfo definition.

personInfo = (firstName="John", middleNames(middleName="Ronald", middleName="Reuel"), lastName="Tolkien")

personInfo = (middleNames(middleName="Ronald", middleName=" Reuel"), lastName="Tolkien", firstName="John")

The instance below is not legal with respect to the definition of personInfo because the order in middleNames is not preserved.

personInfo = (firstName="John", middleNames(middleName=" Reuel", middleName="Ronald"), lastName="Tolkien")

Figure 10: Example of Defining a Structured List Datatype

5.2.2. Enumeration Datatype

SACM defines the following abstract enumeration datatype that is used to represent the restriction of an attribute value to a set of values.
name, hex-value, description
<enumeration-def> -> → <name> ";" <hex-value> ";" <description>
:name -> [0-9a-zA-Z]+ 
:hex-value -> 0x[0-9a-fA-F]+ 
:description -> [0-9a-zA-Z.\,]+ 

Figure 11: Syntax for Defining an Enumeration Datatype

Below is an example of a structured Information Element definition for an enumeration.

Red ; 0x1 ; The color is red.
Orange ; 0x2 ; The color is orange.
Yellow ; 0x3 ; The color is yellow.
Green ; 0x4 ; The color is green.
...

Figure 12: Example of Defining a Structured Enumeration Datatype

5.2.3. Category Datatype

SACM defines the following abstract category datatype that is used to represent a type-choice between a set of information elements.

<category-def> -> "category(" <ie-expression> ")"
<ie-expression> -> <ie-name> ("|" <ie-name>)*
:name -> [0-9a-zA-Z]+ 

Figure 13: Syntax for Defining an Category Datatype

Below is an example of a structured Information Element definition for a category.

targetEndpoint = category(targetEndpointIdentifier | targetEndpointLabel)

Figure 14: Example of Defining a Structured Category Datatype

6. Information Model Assets

In order to represent the Information Elements related to the areas listed in Section 3.1, the information model defines the information needs (or metadata about those information needs) related to following types of assets which are defined in [I-D.ietf-sacm-terminology] (and included below for convenience) which are of interest to SACM. Specifically:

- Endpoint
o Software Component

o Hardware Component

o Identity

o Guidance

o Evaluation Results

The following figure shows the make up of an Endpoint asset which contains zero or more hardware components and zero or more software components each of which may have zero or more instances running an endpoint at any given time as well as zero or more identities that act on behalf of the endpoint when interfacing with other endpoints, tools, or services. An endpoint may also contain other endpoints in the case of a virtualized environment.

Figure 15: Model of an Endpoint

6.1. Asset

As defined in [RFC4949], an asset is a system resource that is (a) required to be protected by an information system’s security policy,
(b) intended to be protected by a countermeasure, or (c) required for a system’s mission.

In the scope of SACM, an asset can be composed of other assets. Examples of Assets include: Endpoints, Software, Guidance, or Identity. Furthermore, an asset is not necessarily owned by an organization.

6.2. Endpoint

From [RFC5209], an endpoint is any computing device that can be connected to a network. Such devices normally are associated with a particular link layer address before joining the network and potentially an IP address once on the network. This includes: laptops, desktops, servers, cell phones, or any device that may have an IP address.

To further clarify, an endpoint is any physical or virtual device that may have a network address. Note that, network infrastructure devices (e.g. switches, routers, firewalls), which fit the definition, are also considered to be endpoints within this document.

Physical endpoints are always composites that are composed of hardware components and software components. Virtual endpoints are composed entirely of software components and rely on software components that provide functions equivalent to hardware components.

The SACM architecture differentiates two essential categories of endpoints: Endpoints whose security posture is intended to be assessed (target endpoints) and endpoints that are specifically excluded from endpoint posture assessment (excluded endpoints).

6.3. Hardware Component

Hardware components are the distinguishable physical components that compose an endpoint. The composition of an endpoint can be changed over time by adding or removing hardware components. In essence, every physical endpoint is potentially a composite of multiple hardware components, typically resulting in a hierarchical composition of hardware components. The composition of hardware components is based on interconnects provided by specific hardware types (e.g. mainboard is a hardware type that provides local busses as an interconnect). In general, a hardware component can be distinguished by its serial number.

Examples of a hardware components include: motherboards, network interfaces, graphics cards, hard drives, etc.
6.4. Software Component

A software package installed on an endpoint (including the operating system) as well as a unique serial number if present (e.g. a text editor associated with a unique license key).

It should be noted that this includes both benign and harmful software packages. Examples of benign software components include: applications, patches, operating system kernel, boot loader, firmware, code embedded on a webpage, etc. Examples of malicious software components include: malware, trojans, viruses, etc.

6.4.1. Software Instance

A running instance of the software component (e.g. on a multi-user system, one logged-in user has one instance of a text editor running and another logged-in user has another instance of the same text editor running, or on a single-user system, a user could have multiple independent instances of the same text editor running).

6.5. Identity

Any mechanism that can be used to identify an asset during an authentication process. Examples include usernames, user and device certificates, etc. Note, that this is different than the identity of assets in the context of designation as described in Section 11.1.

6.6. Guidance

Guidance is input instructions to processes and tasks, such as collection or evaluation. Guidance influences the behavior of a SACM component and is considered content of the management plane. Guidance can be manually or automatically generated or provided. Typically, the tasks that provide guidance to SACM components have a low-frequency and tend to be sporadic. A prominent example of guidance are target endpoint profiles, but guidance can have many forms, including:

Configuration, e.g. a SACM component’s name, or a CMDB’s IPv6 address.

Profiles, e.g. a set of expected states for network behavior associated with target endpoints employed by specific users.

Policies, e.g. an interval to refresh the registration of a SACM component, or a list of required capabilities for SACM components in a specific location.
6.6.1. Collection Guidance

A collector may need guidance to govern what it collects and when. Collection Guidance provides instructions for a Collector that specifies which endpoint attributes to collect, when to collect them, and how to collect them. Collection Guidance is composed of Target Endpoint Attribute Guidance, Frequency Guidance, and Method Guidance.

- **Target Endpoint Attribute Guidance**: Set of endpoint attributes that are supposed to be collected from a target endpoint. The definition of the set of endpoint attributes is typically based on an endpoint characterization record.

- **Frequency Guidance**: Specifies when endpoint attributes are to be collected.

- **Method Guidance**: Indicates how endpoint attributes are to be collected.

6.6.2. Evaluation Guidance

An evaluator typically needs guidance to govern what it considers to be a good or bad security posture. Evaluation Guidance provides instructions for an Evaluator that specifies which endpoint attributes to evaluate, the desired state of those endpoint attributes, and any special requirements that enable an Evaluator to determine if the endpoint attributes can be used in the evaluation (e.g. freshness of data, how it was collected, etc.). Evaluation Guidance is composed of Target Endpoint Attribute Guidance, Expected Endpoint Attribute Value Guidance, and Frequency Guidance.

- **Target Endpoint Attribute Guidance**: Set of target endpoint attributes that are supposed to be used in an evaluation as well as any requirements on the endpoint attributes. The definition of the set of endpoint attributes is typically based on an endpoint characterization record.

- **Expected Endpoint Attribute Value Guidance**: The expected values of the endpoint attributes described in the Target Endpoint Attribute Guidance.

- **Frequency Guidance**: Specifies when endpoint attributes are to be evaluated.

- **Method Guidance**: Indicates how endpoint attributes are to be collected.
6.6.3. Classification Guidance

A SACM Component carrying out the Target Endpoint Classification Task may need guidance on how to classify an endpoint. Specifically, how to associate endpoint classes with a specific target endpoint characterization record. Target Endpoint Classes function as guidance for collection, evaluation, remediation and security posture assessment in general. Classification Guidance is composed of Target Endpoint Attribute Guidance and Class Guidance.

- Target Endpoint Attribute Guidance: Set of target endpoint attributes that are supposed to be used to identify the endpoint characterization record.
- Class Guidance: A list of target endpoint classes that are to be associated with the identified target endpoint characterization record.

6.6.4. Storage Guidance

An SACM Component typically needs guidance to govern what information it should store and where. Storage Guidance provides instructions for a SACM Component that specifies which security automation information should be stored, for how long, and on which endpoint. Storage Guidance is composed of Target Endpoint Attribute Guidance, Expected Security Automation Information Guidance, and Retention Guidance.

- Target Endpoint Attribute Guidance: Set of target endpoint attributes that are supposed to be used to identify the endpoint where the security automation information is to be stored.
- Expected Security Automation Information Guidance: The security automation information that is expected to be stored (guidance, collected posture attributes, results, etc.).
- Retention Guidance: Specifies how long the security automation information should be stored.

6.6.5. Evaluation Results

Evaluation Results are the output of comparing the actual state of an endpoint against the expected state of an endpoint. In addition to the actual results of the comparison, Evaluation Results should include the Evaluation Guidance and actual target endpoint attributes values used to perform the evaluation.
7. Information Model Elements

This section defines the specific Information Elements and relationships that will be implemented by data models and transported between SACM Components.

7.1. sacmStatement

elementId: TBD
name: sacmStatement
dataType: orderedList
status: current
description: Associates SACM Statement Metadata which provides data origin information about the providing SACM Component with one or more SACM Content Elements that contain security automation information.
structure: orderedList(sacmStatementMetadata, sacmContentElement+)

7.2. sacmStatementMetadata

elementId: TBD
name: sacmStatementMetadata
dataType: orderedList
status: current
description: Contains IEs that provide information about the data origin of the providing SACM Component as well as the information necessary for other SACM Components to understand the type of security automation information in the SACM Statement’s SACM Content Element(s).
structure: orderedList(publicationTimestamp, dataOrigin, anyIE*)

7.3. sacmContentElement

elementId: TBD
name: sacmContentElement
dataType: list
status: current
description: Associates SACM Content Element Metadata which provides information about the data source and type of security automation information with the actual security automation information.
structure: TODO
7.4. **sacmContentElementMetadata**

- **elementId**: TBD
- **name**: sacmContentElementMetadata
- **dataType**: orderedList
- **status**: current
- **description**: Contains IEs that provide information about the data source and type of security automation information such that other SACM Components are able to parse and understand the security automation information contained within the SACM Statement’s SACM Content Element(s).
- **structure**: orderedList(collectionTimestamp, targetEndpoint, anyIE*)

7.5. **targetEndpoint**

- **elementId**: TBD
- **name**: targetEndpoint
- **dataType**: category
- **status**: current
- **description**: Information that identifies a target endpoint on the network. This may be a set of attributes that can be used to identify an endpoint on the network or a label that is unique to a SACM domain.
- **structure**: category(targetEndpointIdentifier | targetEndpointLabel)

7.6. **targetEndpointIdentifier**

- **elementId**: TBD
- **name**: targetEndpointIdentifier
- **dataType**: list
- **status**: current
- **description**: A set of attributes that uniquely identify a target endpoint on the network.
- **structure**: list(anyIE*)

7.7. **targetEndpointLabel**

- **elementId**: TBD
- **name**: targetEndpointLabel
- **dataType**: string
- **status**: current
- **description**: A label that uniquely identifies a target endpoint on SACM domain.
7.8. anyIE

    elementId: TBD
    name: anyIE
    dataType: category
    status: current
    description: This category is a placeholder for any information element defined within the SACM Information Model. Its purpose is to provide an extension point in other information elements that enable them to support the specific needs of an enterprise, user, product, or service.

7.9. accessPrivilegeType

    elementId: TBD
    name: accessPrivilegeType
    dataType: string
    status: current
    description: A set of types that represent access privileges (read, write, none, etc.).

7.10. accountName

    elementId: TBD
    name: accountName
    dataType: string
    status: current
    description: A label that uniquely identifies an account that can require some form of (user) authentication to access.

7.11. administrativeDomainType

    elementId: TBD
    name: administrativeDomainType
    dataType: string
    status: current
    description: A label that is supposed to uniquely identify an administrative domain.

7.12. addressAssociationType
7.13. addressMaskValue

elemId: TBD
name: addressMaskValue
datatype: string
status: current
description: A value that expresses a generic address subnetting bitmask.

7.14. addressType

elemId: TBD
name: addressType
datatype: string
status: current
description: A set of types that specifies the type of address that is expressed in an address subject (e.g. ethernet, modbus, zigbee).

7.15. addressValue

elemId: TBD
name: addressValue
datatype: string
status: current
description: A value that expresses a generic network address.

7.16. applicationComponent

elemId: TBD
name: applicationComponent
datatype: string
status: current
description: A label that references a "sub"-application that is part of the application (e.g. an add-on, a cipher-suite, a library).
7.17. applicationLabel

    elementId: TBD
    name: applicationLabel
    dataType: string
    status: current
    description: A label that is supposed to uniquely reference an application.

7.18. applicationType

    elementId: TBD
    name: applicationType
    dataType: string
    status: current
    description: A set of types (FIXME maybe a finite set is not realistic here - value not enumerator?) that identifies the type of (user-space) application (e.g. text-editor, policy-editor, service-client, service-server, calendar, rouge-like RPG).

7.19. applicationManufacturer

    elementId: TBD
    name: applicationManufacturer
    dataType: string
    status: current
    description: The name of the vendor that created the application.

7.20. authenticator

    elementId: TBD
    name: authenticator
    dataType: string
    status: current
    description: A label that references a SACM component that can authenticate target endpoints (can be used in a target-endpoint subject to express that the target endpoint was authenticated by that SACM component.

7.21. authenticationType
7.22. birthdate

    elementId: TBD
    name: birthdate
    dataType: string
    status: current
    description: A label for the registered day of birth
    of a natural person (e.g. the date of birth of a person
    as an ISO date string).
    references: http://rs.tdwg.org/ontology/voc/Person#birthdate

7.23. bytesReceived

    elementId: TBD
    name: bytesReceived
    dataType: string
    status: current
    description: A value that represents a number of octets
    received on a network interface.

7.24. bytesReceived

    elementId: TBD
    name: bytesReceived
    dataType: string
    status: current
    description: A value that represents the number of
    octets received on a network interface.

7.25. bytesSent

    elementId: TBD
    name: bytesSent
    dataType: string
    status: current
    description: A value that represents the number of
    octets sent on a network interface.
7.26. certificate

    elementId: TBD
    name: certificate
    dataType: string
    status: current
    description: A value that expresses a certificate that can be collected from a target endpoint.

7.27. collectionTaskType

    elementId: TBD
    name: collectionTaskType
    dataType: string
    status: current
    description: A set of types that defines how collected SACM content was acquired (e.g. network-observation, remote-acquisition, self-reported, derived, authority, verified).

7.28. confidence

    elementId: TBD
    name: confidence
    dataType: string
    status: current
    description: A representation of the subjective probability that the assessed value is correct. If no confidence value is given, it is assumed that the confidence is 1. Acceptable values are between 0 and 1.

7.29. contentAction

    elementId: TBD
    name: contentAction
    dataType: string
    status: current
    description: A set of types that express a type of action (e.g. add, delete, update). It can be associated, for instance, with an event subject or with a network observation.

7.30. countryCode
elementId: TBD
name: countryCode
dataType: string
status: current
description: A set of types according to ISO 3166-1.

7.31. dataOrigin

elementId: TBD
name: dataOrigin
dataType: string
status: current
description: A label that uniquely identifies a SACM component in and across SACM domains.

7.32. dataSource

elementId: TBD
name: dataSource
dataType: string
status: current
description: A label that is supposed to uniquely identify the data source (e.g. a target endpoint or sensor) that provided an initial endpoint attribute record.

7.33. default-depth

elementId: TBD
name: default-depth
dataType: string
status: current
description: A value that expresses how often a circular reference of subject is allowed to repeat, or how deep a recursive nesting may occur, respectively.

7.34. discoverer

elementId: TBD
name: discoverer
dataType: string
status: current
description: A label that refers to the SACM component that discovered a target endpoint (can be used in a target-endpoint subject to express, for example, that the target endpoint was authenticated by that SACM component).
7.35. emailAddress

   elementId: TBD
   name: emailAddress
   dataType: string
   status: current
   description: A value that expresses an email-address.

7.36. eventType

   elementId: TBD
   name: eventType
   dataType: string
   status: current
   description: a set of types that define the categories of an event (e.g. access-level-change, change-of-priviledge, change-of-authorization, environmental-event, or provisioning-event).

7.37. eventThreshold

   elementId: TBD
   name: eventThreshold
   dataType: string
   status: current
   description: if applicable, a value that can be included in an event subject to indicate what numeric threshold value was crossed to trigger that event.

7.38. eventThresholdName

   elementId: TBD
   name: eventThresholdName
   dataType: string
   status: current
   description: If an event is created due to a crossed threshold, the threshold might have a name associated with it that can be expressed via this value.

7.39. eventTrigger

   elementId: TBD
   name: eventTrigger
   dataType: string
   status: current
   description: This value is used to express more complex trigger conditions that may cause the creation of an event.
7.40. firmwareId

elementId: TBD
ame: firmwareId
dataType: string
status: current
description: A label that represents the BIOS or firmware ID of a specific target endpoint.

7.41. hostName

elementId: TBD
name: hostName
dataType: string
status: current
description: A label typically associated with an endpoint, but, not always intended to be unique given scope.

7.42. interfaceLabel

elementId: TBD
name: interfaceLabel
dataType: string
status: current
description: A unique label that can be used to reference a network interface.

7.43. ipv6AddressSubnetMask

elementId: TBD
name: ipv6AddressSubnetMask
dataType: string
status: current
description: An IPv6 subnet bitmask.

7.44. ipv6AddressSubnetMaskCidrNotation

elementId: TBD
name: ipv6AddressSubnetMaskCidrNotation
dataType: string
status: current
description: An IPv6 subnet bitmask in CIDR notation.
7.45. ipv6AddressValue

    elementId: TBD
    name: ipv6AddressValue
    dataType: ipv6Address
    status: current
    description: An IPv6 subnet bitmask in CIDR notation.
               a network interface.

7.46. ipv4AddressSubnetMask

    elementId: TBD
    name: ipv4AddressSubnetMask
    dataType: string
    status: current
    description: An IPv4 subnet bitmask.

7.47. ipv4AddressSubnetMaskCidrNotation

    elementId: TBD
    name: ipv4AddressSubnetMaskCidrNotation
    dataType: string
    status: current
    description: An IPv4 subnet bitmask in CIDR notation.

7.48. ipv4AddressValue

    elementId: TBD
    name: ipv4AddressValue
    dataType: ipv4Address
    status: current
    description: An IPv4 address value.

7.49. layer2InterfaceType

    elementId: TBD
    name: layer2InterfaceType
    dataType: string
    status: current
    description: A set of types referenced by IANA ifType.

7.50. layer4PortAddress
elementId: TBD
name: layer4PortAddress
dataType: unsigned32
status: current
description: A layer 4 port address typically associated with TCP and UDP protocols.

7.51. layer4Protocol

elementId: TBD
name: layer4Protocol
dataType: string
status: current
description: A set of types that express a layer 4 protocol (e.g. UDP or TCP).

7.52. locationName

elementId: TBD
name: locationName
dataType: string
status: current
description: A value that represents a named region of physical space.

7.53. networkZoneLocation

elementId: TBD
name: networkZoneLocation
dataType: string
status: current
description: The zone location of an endpoint on the network (e.g. internet, enterprise DMZ, enterprise WAN, enclave DMZ, enclave).

7.54. layer2NetworkLocation

elementId: TBD
name: layer2NetworkLocation
dataType: string
status: current
description: The location of a layer-2 interface on the network (e.g. link-layer neighborhood, shared broadcast domain).
7.55. layer3NetworkLocation

    elementId: TBD
    name: layer3NetworkLocation
    dataType: string
    status: current
    description: The location of a layer-3 interface on the network (e.g. next-hop routing neighbor).

7.56. macAddressValue

    elementId: TBD
    name: macAddressValue
    dataType: string
    status: current
    description: A value that expresses an Ethernet address.

7.57. methodLabel

    elementId: TBD
    name: methodLabel
    dataType: string
    status: current
    description: A label that references a specific method registered and used in a SACM domain (e.g. method to match and re-identify target endpoints via identifying attributes).

7.58. methodRepository

    elementId: TBD
    name: methodRepository
    dataType: string
    status: current
    description: A label that references a SACM component methods can be registered at and that can provide guidance in the form of registered methods to other SACM components.

7.59. networkAccessLevelType

    elementId: TBD
    name: networkAccessLevelType
    dataType: string
    status: current
    description: A set of types that expresses categories of network access-levels (e.g. block, quarantine, etc.).
7.60. networkId

    elementId: TBD
    name: networkId
    dataType: string
    status: current
    description: Most networks such as AS, OSBF domains, or VLANs can have an ID.

7.61. networkInterfaceName

    elementId: TBD
    name: networkInterfaceName
    dataType: string
    status: current
    description: A label that uniquely identifies an interface associated with a distinguishable endpoint.

7.62. networkLayer

    elementId: TBD
    name: networkLayer
    dataType: string
    status: current
    description: A set of layers that expresses the specific network layer an interface operates on.

7.63. networkName

    elementId: TBD
    name: networkName
    dataType: string
    status: current
    description: A label that is associated with a network. Some networks, for example, effective layer2-broadcast-domains are difficult to "grasp" and therefore quite difficult to name.

7.64. organizationId

    elementId: TBD
    name: organizationId
    dataType: string
    status: current
    description: A label that uniquely identifies an organization via a PEN.
7.65. patchId

    elementId: TBD
    name: patchId
    dataType: string
    status: current
    description: A label that uniquely identifies a specific software patch.

7.66. patchName

    elementId: TBD
    name: patchName
    dataType: string
    status: current
    description: The vendor’s name of a software patch.

7.67. personFirstName

    elementId: TBD
    name: personFirstName
    dataType: string
    status: current
    description: The first name of a natural person.

7.68. personLastName

    elementId: TBD
    name: personLastName
    dataType: string
    status: current
    description: The last name of a natural person.

7.69. personMiddleName

    elementId: TBD
    name: personMiddleName
    dataType: string
    status: current
    description: The middle name of a natural person.

7.70. phoneNumber
elementId: TBD
name: phoneNumber
dataType: string
status: current
description: A label that expresses the U.S. national phone number (e.g. pattern value="((\d(3)) )?\d(3)-\d(4)").

7.71. phoneNumberType

elementId: TBD
name: phoneNumberType
dataType: string
status: current
description: A set of types that express the type of a phone number (e.g. DSN, Fax, Home, Mobile, Pager, Secure, Unsecure, Work, Other).

7.72. privilegeName

elementId: TBD
name: privilegeName
dataType: string
status: current
description: The attribute name of the privilege represented as an AVP.

7.73. privilegeValue

elementId: TBD
name: privilegeValue
dataType: string
status: current
description: The value content of the privilege represented as an AVP.

7.74. protocol

elementId: TBD
name: protocol
dataType: string
status: current
description: A set of types that defines specific protocols above layer 4 (e.g. http, https, dns, ipp, or unknown).
7.75. publicKey

   elementId: TBD
   name: publicKey
   dataType: string
   status: current
   description: The value of a public key (regardless of its method of creation, crypto-system, or signature scheme) that can be collected from a target endpoint.

7.76. relationshipContentElementGuid

   elementId: TBD
   name: relationshipContentElementGuid
   dataType: string
   status: current
   description: A reference to a specific content element used in a relationship subject.

7.77. relationshipStatementElementGuid

   elementId: TBD
   name: relationshipStatementElementGuid
   dataType: string
   status: current
   description: A reference to a specific SACM statement used in a relationship subject.

7.78. relationshipObjectLabel

   elementId: TBD
   name: relationshipObjectLabel
   dataType: string
   status: current
   description: A reference to a specific label used in content (e.g. a te-label or a user-id). This reference is typically used if matching content attribute can be done efficiently and can also be included in addition to a relationship-content-element-guid reference.

7.79. relationshipType
elementId: TBD
name: relationshipType
dataType: string
status: current
description: A set of types that is in every instance of a relationship subject to highlight what kind of relationship exists between the subject the relationship is included in (e.g. associated_with_user, applies_to_session, seen_on_interface, associated_with_flow, contains_virtual_device).

7.80. roleName

elementId: TBD
name: roleName
dataType: string
status: current
description: A label that references a collection of privileges assigned to a specific entity (identity? FIXME).

7.81. sessionStateType

elementId: TBD
name: sessionStateType
dataType: string
status: current
description: A set of types a discernible session (an ongoing network interaction) can be in (e.g. Authenticating, Authenticated, Postured, Started, Disconnected).

7.82. statementGuid

elementId: TBD
name: statementGuid
dataType: string
status: current
description: A label that expresses a global unique ID referencing a specific SACM statement that was produced by a SACM component.

7.83. statementType
elementId: TBD
declaration: A set of types that define the type of content that is included in a SACM statement (e.g. Observation, DirectoryContent, Correlation, Assessment, Guidance, Event).

7.84. status
declaration: A set of types that defines possible result values for a finding in general (e.g. true, false, error, unknown, not applicable, not evaluated).

7.85. subAdministrativeDomain
declaration: A label for related child domains an administrative domain can be composed of (used in the subject administrative-domain)

7.86. subInterfaceLabel
declaration: A unique label a sub network interface (e.g. a tagged vlan on a trunk) can be referenced with.

7.87. superAdministrativeDomain
declaration: a label for related parent domains an administrative domain is part of (used in the subject s.administrative-domain).
7.88.  superInterfaceLabel

elementId: TBD
name: superInterfaceLabel
dataType: string
status: current
description: a unique label a super network interface
  (e.g. a physical interface a tunnel
  interface terminates on) can be referenced
  with.

7.89.  teAssessmentState

elementId: TBD
name: teAssessmentState
dataType: string
status: current
description: a set of types that defines the state of
  assessment of a target-endpoint (e.g.
  in-discovery, discovered, in-classification,
  classified, in-assessment, assessed).

7.90.  teLabel

elementId: TBD
name: teLabel
dataType: string
status: current
description: an identifying label created from a set
  of identifying attributes used to reference
  a specific target endpoint.

7.91.  teId

elementId: TBD
name: teId
dataType: string
status: current
description: an identifying label that is created
  randomly, is supposed to be unique, and
  used to reference a specific target endpoint.

7.92.  timestampType
elementId: TBD
game: timestampType
dataType: string
status: current
description: a set of types that express what type of
action or event happened at that point
of time (e.g. discovered, classified,
collected, published). Can be included in
a generic s.timestamp subject.

7.93. unitsReceived

elementId: TBD
name: unitsReceived
dataType: string
status: current
description: a value that represents a number of units
(e.g. frames, packets, cells or segments)
received on a network interface.

7.94. unitsSent

elementId: TBD
name: unitsSent
dataType: string
status: current
description: a value that represents a number of units
(e.g. frames, packets, cells or segments)
sent on a network interface.

7.95. userDirectory

elementId: TBD
name: userDirectory
dataType: string
status: current
description: a label that identifies a specific type
of user-directory (e.g. ldap, active-directory,
local-user).

7.96. sacmUserId

elementId: TBD
name: sacmUserId
dataType: string
status: current
description: a label that references a specific user
known in a SACM domain.
7.97.  webSite

    elementId: TBD
    name: webSite
    dataType: string
    status: current
    description: a URI that references a web-site.

7.98.  WGS84Longitude

    elementId: TBD
    name: WGS84Longitude
    dataType: float64
    status: current
    description: a label that represents WGS 84 rev 2004 longitude.

7.99.  WGS84Latitude

    elementId: TBD
    name: WGS84Latitude
    dataType: float64
    status: current
    description: a label that represents WGS 84 rev 2004 latitude.

7.100.  WGS84Altitude

    elementId: TBD
    name: WGS84Altitude
    dataType: float64
    status: current
    description: a label that represents WGS 84 rev 2004 altitude.

7.101.  hardwareSerialNumber

    elementId: TBD
    name: hardwareSerialNumber
    dataType: string
    status: current
    description: A globally unique identifier for a particular piece of hardware assigned by the vendor.
7.102.  interfaceName

   elementId: TBD
   name: interfaceName
   dataType: string
   status: current
   description: A short name uniquely describing an interface, eg "Eth1/0". See [RFC2863] for the definition of the ifName object.

7.103.  interfaceIndex

   elementId: TBD
   name: interfaceIndex
   dataType: unsigned32
   status: current
   description: The index of an interface installed on an endpoint. The value matches the value of managed object 'ifIndex' as defined in [RFC2863]. Note that ifIndex values are not assigned statically to an interface and that the interfaces may be renumbered every time the device’s management system is re-initialized, as specified in [RFC2863].

7.104.  interfaceMacAddress

   elementId: TBD
   name: interfaceMacAddress
   dataType: macAddress
   status: current
   description: The IEEE 802 MAC address associated with a network interface on an endpoint.

7.105.  interfaceType

   elementId: TBD
   name: interfaceType
   dataType: unsigned32
   status: current
   description: The type of a network interface. The value matches the value of managed object 'ifType' as defined in [IANA registry ianaiftype-mib].

7.106.  interfaceFlags
elementId: TBD
description: This information element specifies the flags associated with a network interface. Possible values include:
structure: Up ; 0x1 ; Interface is up.
Broadcast ; 0x2 ; Broadcast address valid.
Debug ; 0x4 ; Turn on debugging.
Loopback ; 0x8 ; Is a loopback net.
Point-to-point ; 0x10 ; Interface is point-to-point link.
No trailers ; 0x20 ; Avoid use of trailers.
Resources allocated ; 0x40 ; Resources allocated.
No ARP ; 0x80 ; No address resolution protocol.
Receive all ; 0x100 ; Receive all packets.

7.107. networkInterface

elementId: TBD
description: Information about a network interface installed on an endpoint. The following high-level diagram describes the structure of networkInterface information element.
structure: orderedList(interfaceName, interfaceIndex, macAddress, interfaceType, flags)

7.108. softwareIdentifier

elementId: TBD
description: A globally unique identifier for a particular software application.

7.109. softwareTitle

elementId: TBD
description: The title of the software application.
7.110. softwareCreator

    elementId: TBD
    name: softwareCreator
    dataType: string
    status: current
    description: The software developer (e.g., vendor or author).

7.111. simpleSoftwareVersion

    elementId: TBD
    name: simpleSoftwareVersion
    dataType: string
    status: current
    description: The version string for a software application that conforms to the format of a list of hierarchical non-negative integers separated by a single character delimiter format.

7.112. rpmSoftwareVersion

    elementId: TBD
    name: rpmSoftwareVersion
    dataType: string
    status: current
    description: The version string for a software application that conforms to the EPOCH:VERSION-RELEASE format.

7.113. ciscoTrainSoftwareVersion

    elementId: TBD
    name: ciscoTrainSoftwareVersion
    dataType: string
    status: current
    description: The version string for a software application that conforms to the Cisco IOS Train string format.

7.114. softwareVersion
elementId: TBD
name: softwareVersion
dataType: category
status: current
description: The version of the software application. Software applications may be versioned using a number of schemas. The following high-level diagram describes the structure of the softwareVersion information element.
structure: category(simpleSoftwareVersion | rpmSoftwareVersion | ciscoTrainSoftwareVersion)

7.115. softwareLastUpdated

elementId: TBD
name: softwareLastUpdated
dataType: dateTimeSeconds
status: current
description: The date and time when the software instance was last updated on the system (e.g., new version installed or patch applied)

7.116. softwareClass

elementId: TBD
name: softwareClass
dataType: enumeration
status: current
description: The class of the software instance.
structure:
Unknown ; 0x1 ; The class is not known.
Other ; 0x2 ; The class is known, but, something other than a value listed in the enumeration.
Driver ; 0x3 ; The class is a device driver.
Configuration Software ; 0x4 ; The class is configuration software.
Application Software ; 0x5 ; The class is application software.
Instrumentation ; 0x6 ; The class is instrumentation.
Diagnostic Software ; 0x8 ; The class is diagnostic software.
Operating System ; 0x9 ; The class is operating system.
Middleware ; 0xA ; The class is middleware.
Firmware ; 0xB ; The class is firmware.
BIOS/FCode ; 0xC ; The class is BIOS or FCode.
Support/Service Pack ; 0xD ; The class is a support or service pack.
Software Bundle ; 0xE ; The class is a software bundle.
References: See Classifications of the DMTF CIM_SoftwareIdentity schema.
7.117. softwareInstance

**elementId**: TBD  
**name**: softwareInstance  
**dataType**: orderedList  
**status**: current  
**description**: Information about an instance of software installed on an endpoint. The following high-level digram describes the structure of softwareInstance information element.  
**structure**: orderedList(softwareIdentifier, softwareTitle, softwareCreator, softwareVersion, softwareLastUpdated, softwareClass)

7.118. globallyUniqueIdentifier

**elementId**: TBD  
**name**: globallyUniqueIdentifier  
**dataType**: unsigned8  
**status**: current  
**description**: TODO.

7.119. creationTimestamp

**elementId**: TBD  
**name**: creationTimestamp  
**dataType**: dateTimeSeconds  
**status**: current  
**description**: The date and time when the posture information was created by a SACM Component.

7.120. collectionTimestamp

**elementId**: TBD  
**name**: collectionTimestamp  
**dataType**: dateTimeSeconds  
**status**: current  
**description**: The date and time when the posture information was collected or observed by a SACM Component.

7.121. publicationTimestamp
elementId: TBD
name: publicationTimestamp
dataType: dateTimeSeconds
status: current
description: The date and time when the posture information was published.

7.122. relayTimestamp

elementId: TBD
name: relayTimestamp
dataType: dateTimeSeconds
status: current
description: The date and time when the posture information was relayed to another SACM Component.

7.123. storageTimestamp

elementId: TBD
name: storageTimestamp
dataType: dateTimeSeconds
status: current
description: The date and time when the posture information was stored in a Repository.

7.124. type

elementId: TBD
name: type
dataType: enumeration
status: current
description: The type of data model use to represent some set of endpoint information. The following table lists the set of data models supported by SACM.
structure: TBD

7.125. protocolIdentifier
elementId: TBD
name: protocolIdentifier
dataType: unsigned8
status: current
description: The value of the protocol number in the IP packet header. The protocol number identifies the IP packet payload type. Protocol numbers are defined in the IANA Protocol Numbers registry.

In Internet Protocol version 4 (IPv4), this is carried in the Protocol field. In Internet Protocol version 6 (IPv6), this is carried in the Next Header field in the last extension header of the packet.

7.126. sourceTransportPort

elementId: TBD
name: sourceTransportPort
dataType: unsigned16
status: current
description: The source port identifier in the transport header. For the transport protocols UDP, TCP, and SCTP, this is the source port number given in the respective header. This field MAY also be used for future transport protocols that have 16-bit source port identifiers.

7.127. sourceIPv4PrefixLength

elementId: TBD
name: sourceIPv4PrefixLength
dataType: unsigned8
status: current
description: The number of contiguous bits that are relevant in the sourceIPv4Prefix Information Element.

7.128. ingressInterface
elementId: TBD
name: ingressInterface
dataType: unsigned32
status: current
description: The index of the IP interface where packets of this Flow are being received. The value matches the value of managed object ‘ifIndex’ as defined in [RFC2863]. Note that ifIndex values are not assigned statically to an interface and that the interfaces may be renumbered every time the device’s management system is re-initialized, as specified in [RFC2863].

7.129. destinationTransportPort

elementId: TBD
name: destinationTransportPort
dataType: unsigned16
status: current
description: The destination port identifier in the transport header. For the transport protocols UDP, TCP, and SCTP, this is the destination port number given in the respective header. This field MAY also be used for future transport protocols that have 16-bit destination port identifiers.

7.130. sourceIPv6PrefixLength

elementId: TBD
name: sourceIPv6PrefixLength
dataType: unsigned8
status: current
description: The number of contiguous bits that are relevant in the sourceIPv6Prefix Information Element.

7.131. sourceIPv4Prefix

elementId: TBD
name: sourceIPv4Prefix
dataType: ipv4Address
status: current
description: IPv4 source address prefix.

7.132. destinationIPv4Prefix
elementId: TBD
dataType: ipv4Address
status: current
description: IPv4 destination address prefix.

7.133. sourceMacAddress

elementId: TBD
name: sourceMacAddress
dataType: macAddress
status: current
description: The IEEE 802 source MAC address field.

7.134. ipVersion

elementId: TBD
name: ipVersion
dataType: unsigned8
status: current
description: The IP version field in the IP packet header.

7.135. interfaceDescription

elementId: TBD
name: interfaceDescription
dataType: string
status: current
description: The description of an interface, e.g. "FastEthernet 1/0" or "ISP connection".

7.136. applicationDescription

elementId: TBD
name: applicationDescription
dataType: string
status: current
description: Specifies the description of an application.

7.137. applicationId

elementId: TBD
name: applicationId
dataType: octetArray
status: current
description: Specifies an Application ID per [RFC6759].
7.138. applicationName

elementId: TBD
name: applicationName
dataType: string
status: current
description: Specifies the name of an application.

7.139. exporterIPv4Address

elementId: TBD
name: exporterIPv4Address
dataType: ipv4Address
status: current
description: The IPv4 address used by the Exporting Process. This is used by the Collector to identify the Exporter in cases where the identity of the Exporter may have been obscured by the use of a proxy.

7.140. exporterIPv6Address

elementId: TBD
name: exporterIPv6Address
dataType: ipv6Address
status: current
description: The IPv6 address used by the Exporting Process. This is used by the Collector to identify the Exporter in cases where the identity of the Exporter may have been obscured by the use of a proxy.

7.141. portId

elementId: TBD
name: portId
dataType: unsigned32
status: current
description: An identifier of a line port that is unique per IPFIX Device hosting an Observation Point. Typically, this Information Element is used for limiting the scope of other Information Elements.

7.142. templateId
elementId: TBD
name: templateId
dataType: unsigned16
status: current
description: An identifier of a Template that is locally unique within a combination of a Transport session and an Observation Domain.

Template IDs 0-255 are reserved for Template Sets, Options Template Sets, and other reserved Sets yet to be created. Template IDs of Data Sets are numbered from 256 to 65535.

Typically, this Information Element is used for limiting the scope of other Information Elements. Note that after a re-start of the Exporting Process Template identifiers may be re-assigned.

7.143. collectorIPv4Address

elementId: TBD
name: collectorIPv4Address
dataType: ipv4Address
status: current
description: An IPv4 address to which the Exporting Process sends Flow information.

7.144. collectorIPv6Address

elementId: TBD
name: collectorIPv6Address
dataType: ipv6Address
status: current
description: An IPv6 address to which the Exporting Process sends Flow information.

7.145. informationElementIndex

elementId: TBD
name: informationElementIndex
dataType: unsigned16
status: current
description: A zero-based index of an Information Element referenced by informationElementId within a Template referenced by templateId; used to disambiguate scope for templates containing multiple identical Information Elements.
7.146. informationElementId

   elementId: TBD
   name: informationElementId
   dataType: unsigned16
   status: current
   description: This Information Element contains the ID of another Information Element.

7.147. informationElementDataType

   elementId: TBD
   name: informationElementDataType
   dataType: unsigned8
   status: current
   description: A description of the abstract data type of an IPFIX information element. These are taken from the abstract data types defined in section 3.1 of the IPFIX Information Model [RFC5102]; see that section for more information on the types described in the informationElementDataType sub-registry.

   These types are registered in the IANA IPFIX Information Element Data Type sub-registry. This subregistry is intended to assign numbers for type names, not to provide a mechanism for adding data types to the IPFIX Protocol, and as such requires a Standards Action [RFC5226] to modify.

7.148. informationElementDescription
elementId: TBD
name: informationElementDescription
dataType: string
status: current
description: A UTF-8 [RFC3629] encoded Unicode string containing a human-readable description of an Information Element. The content of the informationElementDescription MAY be annotated with one or more language tags [RFC4646], encoded in-line [RFC2482] within the UTF-8 string, in order to specify the language in which the description is written. Description text in multiple languages MAY tag each section with its own language tag; in this case, the description information in each language SHOULD have equivalent meaning. In the absence of any language tag, the "i-default" [RFC2277] language SHOULD be assumed. See the Security Considerations section for notes on string handling for Information Element type records.

7.149. informationElementName

elementId: TBD
name: informationElementName
dataType: string
status: current
description: A UTF-8 [RFC3629] encoded Unicode string containing the name of an Information Element, intended as a simple identifier. See the Security Considerations section for notes on string handling for Information Element type records.

7.150. informationElementRangeBegin

elementId: TBD
name: informationElementRangeBegin
dataType: unsigned64
status: current
description: Contains the inclusive low end of the range of acceptable values for an Information Element.

7.151. informationElementRangeEnd
elementId: TBD
name: informationElementRangeEnd
dataType: unsigned64
status: current
description: Contains the inclusive high end of the range of acceptable values for an Information Element.

7.152. informationElementSemantics

elementId: TBD
name: informationElementSemantics
dataType: unsigned8
status: current
description: A description of the semantics of an IPFIX Information Element. These are taken from the data type semantics defined in section 3.2 of the IPFIX Information Model [RFC5102]; see that section for more information on the types defined in the informationElementSemantics sub-registry. This field may take the values in Table 7; the special value 0x00 (default) is used to note that no semantics apply to the field; it cannot be manipulated by a Collecting Process or File Reader that does not understand it a priori.

These semantics are registered in the IANA IPFIX Information Element Semantics subregistry. This subregistry is intended to assign numbers for semantics names, not to provide a mechanism for adding semantics to the IPFIX Protocol, and as such requires a Standards Action [RFC5226] to modify.

7.153. informationElementUnits
elementId: TBD
name: informationElementUnits
dataType: unsigned16
status: current
description: A description of the units of an IPFIX Information Element. These correspond to the units implicitly defined in the Information Element definitions in section 5 of the IPFIX Information Model [RFC5102]; see that section for more information on the types described in the informationElementUnits sub-registry. This field may take the values in Table 3 below; the special value 0x00 (none) is used to note that the field is unitless.

These types are registered in the IANA IPFIX Information Element Units subregistry; new types may be added on a First Come First Served [RFC5226] basis.

7.154. applicationCategoryName

elementId: TBD
name: applicationCategoryName
dataType: string
status: current
description: An attribute that provides a first level categorization for each Application ID.

7.155. mibObjectValueInteger

elementId: TBD
name: mibObjectValueInteger
dataType: signed64
status: current
description: An IPFIX Information Element which denotes that the integer value of a MIB object will be exported. The MIB Object Identifier ("mibObjectIdentifier") for this field MUST be exported in a MIB Field Option or via another means. This Information Element is used for MIB objects with the Base Syntax of Integer32 and INTEGER with IPFIX Reduced Size Encoding used as required. The value is encoded as per the standard IPFIX Abstract Data Type of signed64.
7.156. mibObjectValueOctetString

    elementId: TBD
    name: mibObjectValueOctetString
    dataType: octetArray
    status: current
    description: An IPFIX Information Element which denotes that an
    Octet String or Opaque value of a MIB object will
    be exported. The MIB Object Identifier
    ("mibObjectIdentifier") for this field MUST be
    exported in a MIB Field Option or via another means.
    This Information Element is used for MIB objects
    with the Base Syntax of OCTET STRING and Opaque. The
    value is encoded as per the standard IPFIX Abstract
    Data Type of octetArray.

7.157. mibObjectValueOID

    elementId: TBD
    name: mibObjectValueOID
    dataType: octetArray
    status: current
    description: An IPFIX Information Element which denotes that an
    Object Identifier or OID value of a MIB object will
    be exported. The MIB Object Identifier
    ("mibObjectIdentifier") for this field MUST be
    exported in a MIB Field Option or via another means.
    This Information Element is used for MIB objects
    with the Base Syntax of OBJECT IDENTIFIER. Note -
    In this case the "mibObjectIdentifier" will define
    which MIB object is being exported while the value
    contained in this Information Element will be an
    OID as a value. The mibObjectValueOID Information
    Element is encoded as ASN.1/BER [BER] in an
    octetArray.

7.158. mibObjectValueBits
elementId: TBD
description: An IPFIX Information Element which denotes that a set of Enumerated flags or bits from a MIB object will be exported. The MIB Object Identifier ("mibObjectIdentifier") for this field MUST be exported in a MIB Field Option or via another means. This Information Element is used for MIB objects with the Base Syntax of BITS. The flags or bits are encoded as per the standard IPFIX Abstract Data Type of octetArray, with sufficient length to accommodate the required number of bits. If the number of bits is not an integer multiple of octets then the most significant bits at end of the octetArray MUST be set to zero.

7.159. mibObjectValueIPAddress
description: An IPFIX Information Element which denotes that the IPv4 Address of a MIB object will be exported. The MIB Object Identifier ("mibObjectIdentifier") for this field MUST be exported in a MIB Field Option or via another means. This Information Element is used for MIB objects with the Base Syntax of IPaddress. The value is encoded as per the standard IPFIX Abstract Data Type of ipv4Address.

7.160. mibObjectValueCounter
elementId: TBD
dataType: unsigned64
status: current
description: An IPFIX Information Element which denotes that the counter value of a MIB object will be exported. The MIB Object Identifier ("mibObjectIdentifier") for this field MUST be exported in a MIB Field Option or via another means. This Information Element is used for MIB objects with the Base Syntax of Counter32 or Counter64 with IPFIX Reduced Size Encoding used as required. The value is encoded as per the standard IPFIX Abstract Data Type of unsigned64.

7.161. mibObjectValueGauge

elementId: TBD
name: mibObjectValueGauge
dataType: unsigned32
status: current
description: An IPFIX Information Element which denotes that the Gauge value of a MIB object will be exported. The MIB Object Identifier ("mibObjectIdentifier") for this field MUST be exported in a MIB Field Option or via another means. This Information Element is used for MIB objects with the Base Syntax of Gauge32. The value is encoded as per the standard IPFIX Abstract Data Type of unsigned64. This value will represent a non-negative integer, which may increase or decrease, but shall never exceed a maximum value, nor fall below a minimum value.

7.162. mibObjectValueTimeTicks

elementId: TBD
name: mibObjectValueTimeTicks
dataType: unsigned32
status: current
description: An IPFIX Information Element which denotes that the TimeTicks value of a MIB object will be exported. The MIB Object Identifier ("mibObjectIdentifier") for this field MUST be exported in a MIB Field Option or via another means. This Information Element is used for MIB objects with the Base Syntax of TimeTicks. The value is encoded as per the standard IPFIX Abstract Data Type of unsigned32.
7.163. mibObjectValueUnsigned

elementId: TBD
name: mibObjectValueUnsigned
dataType: unsigned64
status: current
description: An IPFIX Information Element which denotes that an unsigned integer value of a MIB object will be exported. The MIB Object Identifier ("mibObjectIdentifier") for this field MUST be exported in a MIB Field Option or via another means. This Information Element is used for MIB objects with the Base Syntax of unsigned64 with IPFIX Reduced Size Encoding used as required. The value is encoded as per the standard IPFIX Abstract Data Type of unsigned64.

7.164. mibObjectValueTable

elementId: TBD
name: mibObjectValueTable
dataType: orderedList
status: current
description: An IPFIX Information Element which denotes that a complete or partial conceptual table will be exported. The MIB Object Identifier ("mibObjectIdentifier") for this field MUST be exported in a MIB Field Option or via another means. This Information Element is used for MIB objects with a SYNTAX of SEQUENCE. This is encoded as a subTemplateList of mibObjectValue Information Elements. The template specified in the subTemplateList MUST be an Options Template and MUST include all the Objects listed in the INDEX clause as Scope Fields.
structure: orderedList(mibObjectValueRow+)

7.165. mibObjectValueRow
elementId: TBD
description: An IPFIX Information Element which denotes that a single row of a conceptual table will be exported. The MIB Object Identifier ("mibObjectIdentifier") for this field MUST be exported in a MIB Field Option or via another means. This Information Element is used for MIB objects with a SYNTAX of SEQUENCE. This is encoded as a subTemplateList of mibObjectValue Information Elements. The subTemplateList exported MUST contain exactly one row (i.e., one instance of the subtemplate). The template specified in the subTemplateList MUST be an Options Template and MUST include all the Objects listed in the INDEX clause as Scope Fields.

structure: orderedList(mibObjectValue+)

7.166. mibObjectIdentifier
description: An IPFIX Information Element which denotes that a MIB Object Identifier (MIB OID) is exported in the (Options) Template Record. The mibObjectIdentifier Information Element contains the OID assigned to the MIB Object Type Definition encoded as ASN.1/BER [BER].

7.167. mibSubIdentifier
description: A non-negative sub-identifier of an Object Identifier (OID).

7.168. mibIndexIndicator
elementId: TBD
name: mibIndexIndicator
dataType: unsigned64
status: current
description: This set of bit fields is used for marking the Information Elements of a Data Record that serve as INDEX MIB objects for an indexed Columnar MIB object. Each bit represents an Information Element in the Data Record with the n-th bit representing the n-th Information Element. A bit set to value 1 indicates that the corresponding Information Element is an index of the Columnar Object represented by the mibFieldValue. A bit set to value 0 indicates that this is not the case.

If the Data Record contains more than 64 Information Elements, the corresponding Template SHOULD be designed such that all INDEX Fields are among the first 64 Information Elements, because the mibIndexIndicator only contains 64 bits. If the Data Record contains less than 64 Information Elements, then the extra bits in the mibIndexIndicator for which no corresponding Information Element exists MUST have the value 0, and must be disregarded by the Collector. This Information Element may be exported with IPFIX Reduced Size Encoding.

7.169. mibCaptureTimeSemantics
elementId: TBD
name: mibCaptureTimeSemantics
dataType: unsigned8
status: current
description: Indicates when in the lifetime of the flow the MIB value was retrieved from the MIB for a mibObjectIdentifier. This is used to indicate if the value exported was collected from the MIB closer to flow creation or flow export time and will refer to the Timestamp fields included in the same record. This field SHOULD be used when exporting a mibObjectValue that specifies counters or statistics.

If the MIB value was sampled by SNMP prior to the IPFIX Metering Process or Exporting Process retrieving the value (i.e., the data is already stale) and it’s important to know the exact sampling time, then an additional observationTime* element should be paired with the OID using structured data. Similarly, if different mibCaptureTimeSemantics apply to different mibObject elements within the Data Record, then individual mibCaptureTimeSemantics should be paired with each OID using structured data.

Values:
0. undefined
1. begin - The value for the MIB object is captured from the MIB when the Flow is first observed
2. end - The value for the MIB object is captured from the MIB when the Flow ends
3. export - The value for the MIB object is captured from the MIB at export time
4. average - The value for the MIB object is an average of multiple captures from the MIB over the observed life of the Flow

7.170. mibContextEngineID

elementId: TBD
name: mibContextEngineID
dataType: octetArray
status: current
description: A mibContextEngineID that specifies the SNMP engine ID for a MIB field being exported over IPFIX. Definition as per [RFC3411] section 3.3.
7.171.  mibContextName

elementId: TBD
name: mibContextName
dataType: string
status: current
description: This Information Element denotes that a MIB Context Name is specified for a MIB field being exported over IPFIX. Reference [RFC3411] section 3.3.

7.172.  mibObjectName

elementId: TBD
name: mibObjectName
dataType: string
status: current
description: The name (called a descriptor in [RFC2578]) of an object type definition.

7.173.  mibObjectDescription

elementId: TBD
name: mibObjectDescription
dataType: string
status: current
description: The value of the DESCRIPTION clause of an MIB object type definition.

7.174.  mibObjectSyntax

elementId: TBD
name: mibObjectSyntax
dataType: string
status: current
description: The value of the SYNTAX clause of an MIB object type definition, which may include a Textual Convention or Subtyping. See [RFC2578].

7.175.  mibModuleName

elementId: TBD
name: mibModuleName
dataType: string
status: current
description: The textual name of the MIB module that defines a MIB Object.
7.176. interface

    elementId: TBD
    name: interface
    dataType: list
    structure: list (interfaceName, hwAddress, inetAddr, netmask)
    status: current
    description: Represents an interface and its configuration options.

7.177. iflisteners

    elementId: TBD
    name: iflisteners
    dataType: list
    structure: list (interfaceName, physicalProtocol, hwAddress, programName, pid, userId)
    status: current
    description: Stores the results of checking for applications that are bound to an ethernet interface on the system.

7.178. physicalProtocol

    elementId: TBD
    name: physicalProtocol
    dataType: enumeration
    structure:
        ETH_P_LOOP ; 0x1 ; Ethernet loopback packet.
        ETH_P_PUP ; 0x2 ; Xerox PUP packet.
        ETH_P_PUPAT ; 0x3 ; Xerox PUP Address Transport packet.
        ETH_P_IP ; 0x4 ; Internet protocol packet.
        ETH_P_X25 ; 0x5 ; CCITT X.25 packet.
        ETH_P_ARP ; 0x6 ; Address resolution packet.
        ETH_P_BBPQ ; 0x7 ; GBBPQ AX.25 ethernet packet.
        ETH_P_IEEEPUP ; 0x8 ; Xerox IEEE802.3 PUP packet.
        ETH_P_IEEEEUPAT ; 0x9 ; Xerox IEEE802.3 PUP address transport packet.
        ETH_P_DEC ; 0xA ; DEC assigned protocol.
        ETH_P_DNA_DL ; 0xB ; DEC DNA Dump/Load.
        ETH_P_DNA_RC ; 0xC ; DEC DNA Remote Console.
        ETH_P_DNA_RT ; 0xD ; DEC DNA Routing.
        ETH_P_LAT ; 0xE ; DEC LAT.
        ETH_P_DIAG ; 0xF ; DEC Diagnostics.
        ETH_P_CUST ; 0x10 ; DEC Customer use.
        ETH_P_SCA ; 0x11 ; DEC Systems Comms Arch.
        ETH_P_RARP ; 0x12 ; Reverse address resolution packet.
        ETH_P_ATALK ; 0x13 ; Appletalk DDP.
        ETH_P_AARP ; 0x14 ; Appletalk AARP.
ETH_P_8021Q ; 0x15 ; 802.1Q VLAN Extended Header.
ETH_P_IPX ; 0x16 ; IPX over DIX.
ETH_P_IPV6 ; 0x17 ; IPv6 over bluebook.
ETH_P_SLOW ; 0x18 ; Slow Protocol. See 802.3ad 43B.
ETH_P_WCP ; 0x19 ; Web-cache coordination protocol.
ETH_P_PPP_DISC ; 0x1A ; PPPoE discovery messages.
ETH_P_PPP_SES ; 0x1B ; PPPoE session messages.
ETH_P_MPLS_UC ; 0x1C ; MPLS Unicast traffic.
ETH_P_MPLS_MC ; 0x1D ; MPLS Multicast traffic.
ETH_P_ATMMPQA ; 0x1E ; MultiProtocol Over ATM.
ETH_P_ATMFATE ; 0x1F ; Frame-based ATM Transport over Ethernet.
ETH_P_AOE ; 0x20 ; ATA over Ethernet.
ETH_P_TIPC ; 0x21 ; TIPC.
ETH_P_802_3 ; 0x22 ; Dummy type for 802.3 frames.
ETH_P_AX25 ; 0x23 ; Dummy protocol id for AX.25.
ETH_P_ALL ; 0x24 ; Every packet.
ETH_P_802_2 ; 0x25 ; 802.2 frames.
ETH_P_SNAP ; 0x26 ; Internal only.
ETH_P_DDCMP ; 0x27 ; DEC DDCMP: Internal only
ETH_P_WAN_PPP ; 0x28 ; Dummy type for WAN PPP frames.
ETH_P_PPP_MP ; 0x29 ; Dummy type for PPP MP frames.
ETH_P_PPPTALK ; 0x2A ; Dummy type for Atalk over PPP.
ETH_P_LOCALTALK ; 0x2B ; Localtalk pseudo type.
ETH_P_TR_802_2 ; 0x2C ; 802.2 frames.
ETH_P_MOBITEX ; 0x2D ; Mobitex.
ETH_P_CONTROL ; 0x2E ; Card specific control frames.
ETH_P_IRDA ; 0x2F ; Linux-IrDA.
ETH_P_ECONET ; 0x30 ; Acorn Econet.
ETH_P_HDLC ; 0x31 ; HDLC frames.
ETH_P_ARCNET ; 0x32 ; 1A for ArcNet.
        ; 0x33 ; The empty string value is permitted here to allow for detailed error reporting.

status: current
description: The physical layer protocol used by the AF_PACKET socket.

7.179. hwAddress

    elementId: TBD
    name: hwAddress
    dataType: string
    status: current
description: The hardware address associated with the interface.
7.180. programName

- elementId: TBD
- name: programName
- dataType: string
- status: current
- description: The name of the communicating program.

7.181. userId

- elementId: TBD
- name: userId
- dataType: unsigned32
- status: current
- description: The numeric user id.

7.182. inetlisteningserver

- elementId: TBD
- name: inetlisteningserver
- dataType: list
- structure: list (transportProtocol, localAddress, localPort, localFullAddress, programName, foreignAddress, foreignPort, foreignFullAddress, pid, userId)
- status: current
- description: Stores the results of checking for network servers currently active on a system. It holds information pertaining to a specific protocol-address-port combination.

7.183. transportProtocol

- elementId: TBD
- name: transportProtocol
- dataType: string
- status: current
- description: The transport-layer protocol (tcp or udp).

7.184. localAddress

- elementId: TBD
- name: localAddress
- dataType: ipAddress
- status: current
- description: This is the IP address being listened to. Note that the IP address can be IPv4 or IPv6.
7.185. localPort

   elementId: TBD
   name: localPort
   dataType: unsigned32
   status: current
   description: This is the TCP or UDP port being listened to.

7.186. localFullAddress

   elementId: TBD
   name: localFullAddress
   dataType: string
   status: current
   description: The IP address and network port on which the program listens, including the local address and the local port. Note that the IP address can be IPv4 or IPv6.

7.187. foreignAddress

   elementId: TBD
   name: foreignAddress
   dataType: ipAddress
   status: current
   description: The IP address with which the program is communicating, or with which it will communicate. Note that the IP address can be IPv4 or IPv6.

7.188. foreignFullAddress

   elementId: TBD
   name: foreignFullAddress
   dataType: ipAddress
   status: current
   description: The IP address and network port to which the program is communicating or will accept communications from, including the foreign address and foreign port. Note that the IP address can be IPv4 or IPv6.

7.189. selinuxboolean
elementId: TBD
ame: selinuxboolean
dataType: list
structure: list (selinuxName, currentStatus, pendingStatus)
status: current
description: Describes the current and pending status of a SELinux boolean.

7.190. selinuxName

elementId: TBD
name: selinuxName
dataType: string
status: current
description: The name of the SELinux boolean.

7.191. currentStatus

elementId: TBD
name: currentStatus
dataType: boolean
status: current
description: Indicates current state of the specified SELinux boolean.

7.192. pendingStatus

elementId: TBD
name: pendingStatus
dataType: boolean
status: current
description: Indicates the pending state of the specified SELinux boolean.

7.193. selinuxsecuritycontext

elementId: TBD
name: selinuxsecuritycontext
dataType: list
structure: list (filepath, path, filename, pid, username, role, domainType, lowSensitivity, lowCategory, highSensitivity, highCategory, rawlowSensitivity, rawlowCategory, rawhighSensitivity, rawhighCategory)
status: current
description: Describes the SELinux security context of a file or process on the local system.
7.194. filepath

   elementId: TBD
   name: filepath
   dataType: string
   status: current
   description: Specifies the absolute path for a file on the
   machine. A directory cannot be specified as a filepath.

7.195. path

   elementId: TBD
   name: path
   dataType: string
   status: current
   description: Specifies the directory component of
   the absolute path to a file on the machine.

7.196. filename

   elementId: TBD
   name: filename
   dataType: string
   status: current
   description: The name of the file.

7.197. pid

   elementId: TBD
   name: pid
   dataType: unsigned32
   status: current
   description: The process ID of the
   process.

7.198. role

   elementId: TBD
   name: role
   dataType: string
   status: current
   description: Specifies the types that a process
   may transition to (domain transitions).
7.199. domainType

   elementId: TBD
   name: domainType
   dataType: string
   status: current
   description: Specifies the domain in which the file is accessible or the domain in which a process executes.

7.200. lowSensitivity

   elementId: TBD
   name: lowSensitivity
   dataType: string
   status: current
   description: Specifies the current sensitivity of a file or process.

7.201. lowCategory

   elementId: TBD
   name: lowCategory
   dataType: string
   status: current
   description: Specifies the set of categories associated with the low sensitivity.

7.202. highSensitivity

   elementId: TBD
   name: highSensitivity
   dataType: string
   status: current
   description: Specifies the maximum range for a file or the clearance for a process.

7.203. highCategory

   elementId: TBD
   name: highCategory
   dataType: string
   status: current
   description: Specifies the set of categories associated with the high sensitivity.
7.204. rawlowSensitivity

  elementId: TBD
  name: rawlowSensitivity
  dataType: string
  status: current
  description: Specifies the current sensitivity of a file or process but in its raw context.

7.205. rawlowCategory

  elementId: TBD
  name: rawlowCategory
  dataType: string
  status: current
  description: Specifies the set of categories associated with the low sensitivity but in its raw context.

7.206. rawhighSensitivity

  elementId: TBD
  name: rawhighSensitivity
  dataType: string
  status: current
  description: Specifies the maximum range for a file or the clearance for a process but in its raw context.

7.207. rawhighCategory

  elementId: TBD
  name: rawhighCategory
  dataType: string
  status: current
  description: Specifies the set of categories associated with the high sensitivity but in its raw context.

7.208. systemdunitdependency

  elementId: TBD
  name: systemdunitdependency
  dataType: list
  status: current
  description: Stores the dependencies of the systemd unit.
7.209. unit

elementId: TBD
name: unit
dataType: string
status: current
description: Refers to the full systemd unit name, which has a form of "$name.$type". For example "cupsd.service". This name is usually also the filename of the unit configuration file.

7.210. dependency

elementId: TBD
name: dependency
dataType: string
status: current
description: Refers to the name of a unit that was confirmed to be a dependency of the given unit.

7.211. systemdunitproperty

elementId: TBD
name: systemdunitproperty
dataType: list
structure: list (unit, property, systemdunitValue)
status: current
description: Stores the properties and values of a systemd unit.

7.212. property

elementId: TBD
name: property
dataType: string
status: current
description: The property associated with a systemd unit.

7.213. systemdunitValue

elementId: TBD
name: systemdunitValue
dataType: string
status: current
description: The value of the property associated with a systemd unit. Exactly one value shall be used for all property types except dbus arrays - each array element shall be represented by one value.
7.214. file

    elementId: TBD
    name: file
    dataType: list
    structure: list (filepath, path, filename, fileType, userId,
                      aTime, cTime, mTime, size)
    status: current
    description: The metadata associated with a file on the endpoint.

7.215. fileType

    elementId: TBD
    name: fileType
    dataType: string
    status: current
    description: The file’s type (e.g., regular file (regular),
                directory, named pipe (fifo), symbolic link, socket or block
                special.)

7.216. groupId

    elementId: TBD
    name: groupId
    dataType: unsigned32
    status: current
    description: The group owner of the file, by
                group number.

7.217. aTime

    elementId: TBD
    name: aTime
    dataType: dateTimeSeconds
    status: current
    description: The time that the file was last
                accessed.

7.218. cTime

    elementId: TBD
    name: cTime
    dataType: dateTimeSeconds
    status: current
    description: The time of the last change
                to the file’s inode.
7.219. mTime

   elementId: TBD
   name: mTime
   dataType: dateTimeSeconds
   status: current
   description: The time of the last change to the file’s contents.

7.220. size

   elementId: TBD
   name: size
   dataType: unsigned32
   status: current
   description: This is the size of the file in bytes.

7.221. suid

   elementId: TBD
   name: suid
   dataType: boolean
   status: current
   description: Indicates whether the program runs with the uid (thus privileges) of the file’s owner, rather than the calling user.

7.222. sgid

   elementId: TBD
   name: sgid
   dataType: boolean
   status: current
   description: Indicates whether the program runs with the gid (thus privileges) of the file’s group owner, rather than the calling user’s group.

7.223. sticky

   elementId: TBD
   name: sticky
   dataType: boolean
   status: current
   description: Indicates whether users can delete each other’s files in this directory, when said directory is writable by those users.
7.224. hasExtendedAcl

    elementId: TBD
    name: hasExtendedAcl
    dataType: boolean
    status: current
    description: Indicates whether the file or directory hasACL permissions applied to it. If a system supports ACLs and the file or directory doesn’t have an ACL, or it matches the standard UNIX permissions, the entity will have a status of ‘exists’ and a value of ‘false’. If the system supports ACLs and the file or directory has an ACL, the entity will have a status of ‘exists’ and a value of ‘true’. Lastly, if a system doesn’t support ACLs, the entity will have a status of ‘does not exist’.

7.225. inetd

    elementId: TBD
    name: inetd
    dataType: list
    structure: list (serviceProtocol, serviceName, serverProgram, serverArguments, endpointType, execAsUser, waitStatus)
    status: current
    description: Holds information associated with different Internet services.

7.226. serverProgram

    elementId: TBD
    name: serverProgram
    dataType: string
    status: current
    description: Either the pathname of a server program to be invoked by inetd to perform the requested service, or the value internal if inetd itself provides the service.

7.227. endpointType
elementId: TBD
name: endpointType
dataType: enumeration
structure:
  stream ; 0x1 ; The stream value is used to describe a stream socket.
  dgram ; 0x2 ; The dgram value is used to describe a datagram socket.
  raw ; 0x3 ; The raw value is used to describe a raw socket.
  seqpacket ; 0x4 ; The seqpacket value is used to describe a sequenced packet socket.
  tli ; 0x5 ; The tli value is used to describe all TLI endpoints.
  sunrpc_tcp ; 0x6 ; The sunrpc_tcp value is used to describe all SUNRPC TCP endpoints.
  sunrpc_udp ; 0x7 ; The sunrpc_udp value is used to describe all SUNRPC UDP endpoints.
  ; 0x8 ; The empty string value is permitted here to allow for detailed error reporting.
status: current
description: The endpoint type (aka, socket type) associated with the service.

7.228. execAsUser

elementId: TBD
name: execAsUser
dataType: string
status: current
description: The user id of the user the server program should run under.

7.229. waitStatus
elementId: TBD
name: waitStatus
dataType: enumeration
structure: wait ; 0x1 ; The value of 'wait' specifies that the server that is invoked by inetd will take over the listening socket associated with the service, and once launched, inetd will wait for that server to exit, if ever, before it resumes listening for new service requests.

nowait ; 0x2 ; The value of 'nowait' specifies that the server that is invoked by inetd will not wait for any existing server to finish before taking over the listening socket associated with the service.

; 0x3 ; The empty string value is permitted here to allow for detailed error reporting.
status: current
description: Specifies whether the server that is invoked by inetd will take over the listening socket associated with the service, and whether once launched, inetd will wait for that server to exit, if ever, before it resumes listening for new service requests. The legal values are "wait" or "nowait".

7.230. inetAddr

elementId: TBD
name: inetAddr
dataType: ipAddress
status: current
description: The IP address of the specific interface. Note that the IP address can be IPv4 or IPv6.

7.231. netmask

elementId: TBD
name: netmask
dataType: ipAddress
status: current
description: The bitmask used to calculate the interface’s IP network.

7.232. passwordInfo
elementId: TBD
name: passwordInfo
dataType: list
structure: list (username, password, userId, groupId, gcos, homeDir, loginShell, lastLogin)
status: current
description: Describes user account information for a system.

7.233. username

    elementId: TBD
    name: username
    dataType: string
    status: current
    description: The name of the user.

7.234. password

    elementId: TBD
    name: password
    dataType: string
    status: current
    description: The encrypted version of the user’s password.

7.235. gcos

    elementId: TBD
    name: gcos
    dataType: string
    status: current
    description:

7.236. homeDir

    elementId: TBD
    name: homeDir
    dataType: string
    status: current
    description: The user’s home directory.

7.237. loginShell
elementId: TBD
name: loginShell
dataType: string
status: current
description: The user’s shell program.

7.238. lastLogin

elementId: TBD
name: lastLogin
dataType: unsigned32
status: current
description: The date and time when the last login occurred.

7.239. process

elementId: TBD
name: process
dataType: list
structure: list (commandLine, pid, ppid, priority, startTime)
status: current
description: Information about a process running on an endpoint.

7.240. commandLine

elementId: TBD
name: commandLine
dataType: string
status: current
description: The string used to start the process. This includes any parameters that are part of the command line.

7.241. ppid

elementId: TBD
name: ppid
dataType: unsigned32
status: current
description: The process ID of the process’s parent process.
7.242. priority

elementId: TBD
ame: priority
dataType: unsigned32
status: current
description: The scheduling priority with which the process runs.

7.243. startTime

elementId: TBD
name: startTime
dataType: string
status: current
description: The time of day the process started.

7.244. routingTable

elementId: TBD
name: routingTable
dataType: list
structure: list (destination, gateway, flags, interfaceName)
status: current
description: Holds information about an individual routing table entry found in a system’s primary routing table.

7.245. destination

elementId: TBD
name: destination
dataType: ipAddress
status: current
description: The destination IP address prefix of the routing table entry.

7.246. gateway

elementId: TBD
name: gateway
dataType: ipAddress
status: current
description: The gateway of the specified routing table entry.
7.247. runlevelInfo

  elementId: TBD
  name: runlevelInfo
  dataType: list
  structure: list (serviceName, runlevel, start, kill)

  status: current
  description: Information about the start or kill state of a specified service at a given runlevel.

7.248. runlevel

  elementId: TBD
  name: runlevel
  dataType: string
  status: current
  description: Specifies the system runlevel associated with a service.

7.249. start

  elementId: TBD
  name: start
  dataType: boolean
  status: current
  description: Specifies whether the service is scheduled to start at the runlevel.

7.250. kill

  elementId: TBD
  name: kill
  dataType: boolean
  status: current
  description: Specifies whether the service is scheduled to be killed at the runlevel.

7.251. shadowItem

  elementId: TBD
  name: shadowItem
  dataType: list
  structure: list (username, password, chgLst, chgAllow, chgReq, expWarn, expInact, expDate, flags, encryptMethod)
  status: current
  description:
7.252. chgLst

   elementId: TBD
   name: chgLst
dataType: dateTimeSeconds
status: current
description: The date of the last password change.

7.253. chgAllow

   elementId: TBD
   name: chgAllow
dataType: unsigned32
status: current
description: Specifies how often in days a user may change their password. It can also be thought of as the minimum age of a password.

7.254. chgReq

   elementId: TBD
   name: chgReq
dataType: unsigned32
status: current
description: Describes how long a user can keep a password before the system forces her to change it.

7.255. expWarn

   elementId: TBD
   name: expWarn
dataType: unsigned32
status: current
description: Describes how long before password expiration the system begins warning the user.

7.256. expInact

   elementId: TBD
   name: expInact
dataType: unsigned32
status: current
description: Describes how many days of account inactivity the system will wait after a password expires before locking the account.
7.257. expDate

   elementId: TBD
elementId: TBD
ame: expDate
name: expDate
datatype: dateTimeSeconds
dataType: dateTimeSeconds
status: current
status: current
description: Specifies when will the
description: Specifies when will the
   account’s password expire.
account’s password expire.

7.258. encryptMethod

   elementId: TBD
elementId: TBD
name: encryptMethod
name: encryptMethod
dataType: enumeration
dataType: enumeration

   passwords.

7.259. symlink

   elementId: TBD
elementId: TBD
name: symlink
name: symlink
dataType: list
dataType: list
structure: list (symlinkFilepath, canonicalPath)
structure: list (symlinkFilepath, canonicalPath)
status: current
status: current
description: Identifies the result generated for a symlink.
description: Identifies the result generated for a symlink.

7.260. symlinkFilepath

elementId: TBD
name: symlinkFilepath
dataType: string
status: current
description: Specifies the filepath to the subject symbolic link file.

7.261. canonicalPath

elementId: TBD
name: canonicalPath
dataType: string
status: current
description: Specifies the canonical path for the target of the symbolic link file specified by the filepath.

7.262. sysctl

elementId: TBD
name: sysctl
dataType: list
structure: list (kernelParameterName, kernelParameterValue+,
uname, machineClass, nodeName, osName, osRelease,
osVersion, processorType)
status: current
description: Stores information retrieved from the local system about a kernel parameter and its respective value(s).

7.263. kernelParameterName

elementId: TBD
name: kernelParameterName
dataType: string
status: current
description: The name of a kernel parameter that was collected from the local system.

7.264. kernelParameterValue

elementId: TBD
name: kernelParameterValue
dataType: string
status: current
description: The current value(s) for the specified kernel parameter on the local system.
7.265.  uname

elementId: TBD
name: uname
dataType: list
structure: list (machineClass, nodeName, osName, osRelease, osVersion, processorType)
status: current
description: Information about the hardware the machine is running on.

7.266.  machineClass

elementId: TBD
name: machineClass
dataType: string
status: current
description: Specifies the machine hardware name.

7.267.  nodeName

elementId: TBD
name: nodeName
dataType: string
status: current
description: Specifies the host name.

7.268.  osName

elementId: TBD
name: osName
dataType: string
status: current
description: Specifies the operating system name.

7.269.  osRelease

elementId: TBD
name: osRelease
dataType: string
status: current
description: Specifies the build version.
7.270. processorType

   elementId: TBD
   name: processorType
   dataType: string
   status: current
   description: Specifies the processor type.

7.271. internetService

   elementId: TBD
   name: internetService
   dataType: list
   structure: list (serviceProtocol, serviceName, flags, 
      noAccess, onlyFrom, port, server, serverArguments, 
      socketType, registeredServiceType, user, wait, disabled) 

   status: current
   description: Holds information associated with Internet services.

7.272. serviceProtocol

   elementId: TBD
   name: serviceProtocol
   dataType: string
   status: current
   description: Specifies the protocol that is used by the service.

7.273. serviceName

   elementId: TBD
   name: serviceName
   dataType: string
   status: current
   description: Specifies the name of the service.

7.274. flags

   elementId: TBD
   name: flags
   dataType: string
   status: current
   description: Specifies miscellaneous settings associated with the service with executing a program.
7.275. noAccess

    elementId: TBD
    name: noAccess
    dataType: string
    status: current
    description: Specifies the remote hosts to which the service is unavailable.

7.276. onlyFrom

    elementId: TBD
    name: onlyFrom
    dataType: ipAddress
    status: current
    description: Specifies the remote hosts to which the service is available.

7.277. port

    elementId: TBD
    name: port
    dataType: unsigned32
    status: current
    description: The port entity specifies the port used by the service.

7.278. server

    elementId: TBD
    name: server
    dataType: string
    status: current
    description: Specifies the executable that is used to launch the service.

7.279. serverArguments

    elementId: TBD
    name: serverArguments
    dataType: string
    status: current
    description: Specifies the arguments that are passed to the executable when launching the service.
7.280. socketType

    elementId: TBD
    name: socketType
    dataType: string
    status: current
    description: Specifies the type of socket that is used by the service. Possible values include: stream, dgram, raw, or seqpacket.

7.281. registeredServiceType

    elementId: TBD
    name: registeredServiceType
    dataType: enumeration
    structure: INTERNAL ; 0x1 ; The INTERNAL type is used to describe services like echo, chargen, and others whose functionality is supplied by xinetd itself.
    RPC ; 0x2 ; The RPC type is used to describe services that use remote procedure call ala NFS.
    UNLISTED ; 0x3 ; The UNLISTED type is used to describe services that aren’t listed in /etc/protocols or /etc/rpc.
    TCPMUX ; 0x4 ; The TCPMUX type is used to describe services that conform to RFC 1078. This type indicates that the service is responsible for handling the protocol handshake.
    TCPMUXPLUS ; 0x5 ; The TCPMUXPLUS type is used to describe services that conform to RFC 1078. This type indicates that xinetd is responsible for handling the protocol handshake.
    ; 0x6 ; The empty string value is permitted here to allow for detailed error reporting.
    status: current
    description: Specifies the type of internet service.

7.282. wait

    elementId: TBD
    name: wait
    dataType: boolean
    status: current
    description: Specifies whether or not the service is single-threaded or multi-threaded and whether or not xinetd accepts the connection or the service accepts the connection. A value of ‘true’ indicates that the service is single-threaded and the service will accept the connection. A value of ‘false’ indicates that the service is multi-threaded and xinetd will accept the connection.
7.283. disabled

elementId: TBD
name: disabled
dataType: boolean
status: current
description: Specifies whether or not the service is disabled. A value of ‘true’ indicates that the service is disabled and will not start. A value of ‘false’ indicates that the service is not disabled.

7.284. windowsView

elementId: TBD
name: windowsView
dataType: enumeration
structure: 32_bit ; 0x1 ; Indicates the 32_bit windows view.
64_bit ; 0x2 ; Indicates the 64_bit windows view.
; 0x3 ; The empty string value is permitted here to allow for empty elements associated with error conditions.
status: current
description: Indicates from which view (32-bit or 64-bit), the information was collected. A value of ‘32_bit’ indicates the Item was collected from the 32-bit view. A value of ‘64-bit’ indicates the Item was collected from the 64-bit view.

7.285. fileauditedpermissions

elementId: TBD
name: fileauditedpermissions
dataType: list
structure: list (filepath, path, filename, trusteeSid, trusteeName, auditStandardDelete, auditStandardReadControl, auditStandardWriteDac, auditStandardWriteOwner, auditStandardSynchronize, auditAccessSystemSecurity, auditGenericRead, auditGenericWrite, auditGenericExecute, auditGenericAll, auditFileReadData, auditFileWriteData, auditFileAppendData, auditFileReadEa, auditFileWriteEa, auditFileExecute, auditFileDeleteChild, auditFileReadAttributes, auditFileWriteAttributes, windowsView)
status: current
description: Stores the audited access rights of a file that a system access control list (SACL) structure grants to a specified trustee. The trustee’s audited access rights are determined checking all access control entries (ACEs) in the SACL.
7.286. trusteeName

   elementId: TBD
   name: trusteeName
   dataType: string
   status: current
   description: Specifies the trustee name. A trustee can be a user, group, or program (such as a Windows service).

7.287. auditStandardDelete

   elementId: TBD
   name: auditStandardDelete
   dataType: enumeration
   structure: AUDIT_FAILURE ; 0x1 ; The audit type AUDIT_FAILURE is used to perform audits on all unsuccessful occurrences of specified events when auditing is enabled.
   AUDIT_NONE ; 0x2 ; The audit type AUDIT_NONE is used to cancel all auditing options for the specified events.
   AUDIT_SUCCESS ; 0x3 ; The audit type AUDIT_SUCCESS is used to perform audits on all successful occurrences of the specified events when auditing is enabled.

    name: fileReadAttributes
    dataType: boolean
    status: current
    description: Grants the right to read file attributes.
7.325. fileWriteAttributes

   elementId: TBD
   name: fileWriteAttributes
   dataType: boolean
   status: current
   description: Grants the right to change file attributes.

7.326. groupInfo

   elementId: TBD
   name: groupInfo
   dataType: list
   structure: list (group, username, subgroup)
   status: current
   description: Specifies the different users and subgroups, that directly belong to specific groups.

7.327. group

   elementId: TBD
   name: group
   dataType: string
   status: current
   description: Represents the name of a particular group.

7.328. subgroup

   elementId: TBD
   name: subgroup
   dataType: string
   status: current
   description: Represents the name of a particular subgroup in the specified group.

7.329. groupSidInfo

   elementId: TBD
   name: groupSidInfo
   dataType: list
   structure: list (groupSid, userSid, subgroupSid)
   status: current
   description: Specifies the different users and subgroups, that directly belong to specific groups (identified by SID).
7.330. userSidInfo

   elementId: TBD
   name: userSidInfo
   dataType: list
   structure: list (userSid, enabled, groupSid, lastLogon)

   status: current
   description: Specifies the different groups (identified by SID) that a user belongs to.

7.331. userSid

   elementId: TBD
   name: userSid
   dataType: string
   status: current
   description: Represents the SID of a particular user.

7.332. subgroupSid

   elementId: TBD
   name: subgroupSid
   dataType: string
   status: current
   description: Represents the SID of a particular subgroup.

7.333. lockoutpolicy

   elementId: TBD
   name: lockoutpolicy
   dataType: list
   structure: list (forceLogoff, lockoutDuration, lockoutObservationWindow, lockoutThreshold)
   status: current
   description: Specifies various attributes associated with lockout information for users and global groups in the security database.

7.334. forceLogoff
elementId: TBD
name: forceLogoff
dataType: unsigned32
status: current
description: Specifies, in seconds, the amount of time between the end of the valid logon time and the time when the user is forced to log off the network.

7.335. lockoutDuration

elementId: TBD
name: lockoutDuration
dataType: unsigned32
status: current
description: Specifies, in seconds, how long a locked account remains locked before it is automatically unlocked.

7.336. lockoutObservationWindow

elementId: TBD
name: lockoutObservationWindow
dataType: unsigned32
status: current
description: Specifies the maximum time, in seconds, that can elapse between any two failed logon attempts before lockout occurs.

7.337. lockoutThreshold

elementId: TBD
name: lockoutThreshold
dataType: unsigned32
status: current
description: Specifies the number of invalid password authentications that can occur before an account is marked "locked out."

7.338. passwordpolicy
elementId: TBD
name: passwordpolicy
dataType: list
structure: list (maxPasswdAge, minPasswdAge, minPasswdLen, passwordHistLen, passwordComplexity, reversibleEncryption)
status: current
description: Specifies policy information associated with passwords.

7.339. maxPasswdAge

elementId: TBD
name: maxPasswdAge
dataType: unsigned32
status: current
description: Specifies, in seconds (from a DWORD), the maximum allowable password age. A value of TIMEQ_FOREVER (max DWORD value, 4294967295) indicates that the password never expires. The minimum valid value for this element is ONE_DAY (86400). See the USER_MODALS_INFO_0 structure returned by a call to NetUserModalsGet().

7.340. minPasswdAge

elementId: TBD
name: minPasswdAge
dataType: unsigned32
status: current
description: Specifies the minimum number of seconds that can elapse between the time a password changes and when it can be changed again. A value of zero indicates that no delay is required between password updates.

7.341. minPasswdLen

elementId: TBD
name: minPasswdLen
dataType: unsigned32
status: current
description: Specifies the minimum allowable password length. Valid values for this element are zero through PWLEN.
7.342. passwordHistLen

  elementId: TBD
  name: passwordHistLen
  dataType: unsigned32
  status: current
  description: Specifies the length of password history maintained. A new password cannot match any of the previous usrmnt0_password_hist_len passwords. Valid values for this element are zero through DEF_MAX_PWHIST.

7.343. passwordComplexity

  elementId: TBD
  name: passwordComplexity
  dataType: boolean
  status: current
  description: Indicates whether passwords must meet the complexity requirements put forth by the operating system.

7.344. reversibleEncryption

  elementId: TBD
  name: reversibleEncryption
  dataType: boolean
  status: current
  description: Indicates whether or not passwords are stored using reversible encryption.

7.345. portInfo

  elementId: TBD
  name: portInfo
  dataType: list
  structure: list (localAddress, localPort, transportProtocol, pid, foreignAddress, foreignPort)
  status: current
  description: Information about open listening ports.

7.346. foreignPort

  elementId: TBD
  name: foreignPort
  dataType: string
  status: current
  description: The TCP or UDP port to which the program communicates.
7.347. printereffectiverights

   elementId: TBD
   name: printereffectiverights
   dataType: list
   structure: list (printerName, trusteeSid,
      standardDelete, standardReadControl, standardWriteDac,
      standardWriteOwner, standardSynchronize,
      accessSystemSecurity, genericRead, genericWrite,
      genericExecute, genericAll, printerAccessAdminister,
      printerAccessUse, jobAccessAdminister, jobAccessRead)
   status: current
   description: Stores the effective rights of a printer that a
discretionary access control list (DACL) structure grants to a
specified trustee. The trustee’s effective rights are determined
checking all access-allowed and access-denied access control
tables (ACEs) in the DACL.

7.348. printerName

   elementId: TBD
   name: printerName
   dataType: string
   status: current
   description: Specifies the name of the
   printer.

7.349. printerAccessAdminister

   elementId: TBD
   name: printerAccessAdminister
   dataType: boolean
   status: current
   description:

7.350. printerAccessUse

   elementId: TBD
   name: printerAccessUse
   dataType: boolean
   status: current
   description:

7.351. jobAccessAdminister
elementId: TBD
ame: jobAccessAdminister
dataType: boolean
status: current
description:

7.352. jobAccessRead

elementId: TBD
name: jobAccessRead
dataType: boolean
status: current
description:

7.353. registry

elementId: TBD
name: registry
dataType: list
structure: list (registryHive, registryKey, registryKeyName, lastWriteTime, registryKeyType, registryKeyValue, windowsView)
status: current
description: Specifies information that can be collected about a particular registry key.

7.354. registryHive
elementId: TBD
dataType: enumeration
structure: HKEY_CLASSES_ROOT ; 0x1 ; This registry subtree contains information that associates file types with programs and configuration data for automation (e.g. COM objects and Visual Basic Programs).
HKEY_CURRENT_CONFIG ; 0x2 ; This registry subtree contains configuration data for the current hardware profile.
HKEY_CURRENT_USER ; 0x3 ; This registry subtree contains the user profile of the user that is currently logged into the system.
HKEY_LOCAL_MACHINE ; 0x4 ; This registry subtree contains information about the local system.
HKEY_USERS ; 0x5 ; This registry subtree contains user-specific data.
; 0x6 ; The empty string value is permitted here to allow for detailed error reporting.
status: current
description: The hive that the registry key belongs to.

7.355. registryKey

elementId: TBD
name: registryKey
dataType: string
status: current
description: Describes the registry key.
 Note that the hive portion of the string should not be included, as this data can be found under the hive element.

7.356. registryKeyName

elementId: TBD
name: registryKeyName
dataType: string
status: current
description: Describes the name of a registry key.

7.357. lastWriteTime
elementId: TBD
name: lastWriteTime
dataType: unsigned64
status: current
description: The last time that the key or any of its value entries were modified. The value of this entity represents the FILETIME structure which is a 64-bit value representing the number of 100-nanosecond intervals since January 1, 1601 (UTC). Last write time can be queried on any key, with hives being classified as a type of key. When collecting only information about a registry hive or key the last write time will be the time the key or any of its entries were modified. When collecting only information about a registry name the last write time will be the time the containing key was modified. Thus when collecting information about a registry name, the last write time does not correlate directly to the specified name. See the RegQueryInfoKey function lpftLastWriteTime.

7.358. registryKeyType

elementId: TBD
name: registryKeyType
dataType: enumeration
structure:
  reg_binary ; 0x1 ; The reg_binary type is used by registry keys that specify binary data in any form.
  reg_dword ; 0x2 ; The reg_dword type is used by registry keys that specify an unsigned 32-bit integer.
  reg_dword_little_endian ; 0x3 ; The reg_dword_little_endian type is used by registry keys that specify an unsigned 32-bit little-endian integer. It is designed to run on little-endian computer architectures.
  reg_dword_big_endian ; 0x4 ; The reg_dword_big_endian type is used by registry keys that specify an unsigned 32-bit big-endian integer. It is designed to run on big-endian computer architectures.
  reg_expand_sz ; 0x5 ; The reg_expand_sz type is used by registry keys to specify a null-terminated string that contains unexpanded references to environment variables (for example, "PATH").
  reg_link ; 0x6 ; The reg_link type is used by the registry keys for null-terminated unicode strings. It is related to target path of a symbolic link created by the RegCreateKeyEx function.
  reg_multi_sz ; 0x7 ; The reg_multi_sz type is used by registry keys that specify an array of null-terminated strings, terminated by two null characters.
The `reg_none` type is used by registry keys that have no defined value type.

The `reg_qword` type is used by registry keys that specify an unsigned 64-bit integer.

The `reg_qword_little_endian` type is used by registry keys that specify an unsigned 64-bit integer in little-endian computer architectures.

The `reg_sz` type is used by registry keys that specify a single null-terminated string.

The `reg_resource_list` type is used by registry keys that specify a resource list.

The `reg_full_resource_descriptor` type is used by registry keys that specify a full resource descriptor.

The `reg_resource_requirements_list` type is used by registry keys that specify a resource requirements list.

The empty string value is permitted here to allow for detailed error reporting.

Specifies the type of data stored by the registry key.

7.359. `registryKeyValue`
elementId: TBD
name: registryKeyValue
dataType: string
status: current
description: Holds the actual value of the specified registry key. The representation of the value as well as the associated datatype attribute depends on type of data stored in the registry key. If the value being tested is of type REG_BINARY, then the datatype attribute should be set to 'binary' and the data represented by the value entity should follow the xsd:hexBinary form. (each binary octet is encoded as two hex digits) If the value being tested is of type REG_DWORD, REG_QWORD, REG_DWORD_LITTLE_ENDIAN, REG_DWORD_BIG_ENDIAN, or REG_QWORD_LITTLE_ENDIAN then the datatype attribute should be set to 'int' and the value entity should represent the data as an unsigned integer. DWORD and QWORD values represnt unsigned 32-bit and 64-bit integers, respectively. If the value being tested is of type REG_EXPAND_SZ, then the datatype attribute should be set to 'string' and the pre-expanded string should be represented by the value entity. If the value being tested is of type REG_MULTI_SZ, then only a single string (one of the multiple strings) should be tested using the value entity with the datatype attribute set to 'string'. In order to test multiple values, multiple OVAL registry tests should be used. If the specified registry key is of type REG_SZ, then the datatype should be 'string' and the value entity should be a copy of the string. If the value being tested is of type REG_LINK, then the datatype attribute should be set to 'string' and the null-terminated Unicode string should be represented by the value entity.

7.360. regkeyauditedpermissions
elementId: TBD
name: regkeyauditedpermissions
dataType: list
structure: list (registryKey, trusteeSid, trusteeName, standardDelete, standardReadControl, standardWriteDac, standardWriteOwner, standardSynchronize, accessSystemSecurity, genericRead, genericWrite, genericExecute, genericAll, keyQueryValue, keySetValue, keyCreateSubKey, keyEnumerateSubKeys, keyNotify, keyCreateLink, keyWow6464Key, keyWow6432Key, keyWow64Res, windowsView)
status: current
description: Stores the audited access rights of a registry key that a system access control list (SACL) structure grants to a specified trustee. The trustee’s audited access rights are determined checking all access control entries (ACEs) in the SACL.

7.361. auditKeyQueryValue

elementId: TBD
name: auditKeyQueryValue
dataType: enumeration
structure: AUDIT_FAILURE ; 0x1 ; The audit type AUDIT_FAILURE is used to perform audits on all unsuccessful occurrences of specified events when auditing is enabled.
AUDIT_NONE ; 0x2 ; The audit type AUDIT_NONE is used to cancel all auditing options for the specified events.
AUDIT_SUCCESS ; 0x3 ; The audit type AUDIT_SUCCESS is used to perform audits on all successful occurrences of the specified events when auditing is enabled.

description: Specifies when the service should be started.

7.385. currentState
elementId: TBD
dataType: enumeration
structure: SERVICE_CONTINUE_PENDING ; 0x1 ; The SERVICE_CONTINUE_PENDING type means that the service has been sent a command to continue, however, the command has not yet been executed. The DWORD value that this corresponds to is 0x00000005.
SERVICE_PAUSE_PENDING ; 0x2 ; The SERVICE_PAUSE_PENDING type means that the service has been sent a command to pause, however, the command has not yet been executed. The DWORD value that this corresponds to is 0x00000006.
SERVICE_PAUSED ; 0x3 ; The SERVICE_PAUSED type means that the service is paused. The DWORD value that this corresponds to is 0x00000007.
SERVICE_RUNNING ; 0x4 ; The SERVICE_RUNNING type means that the service is running. The DWORD value that this corresponds to is 0x00000004.
SERVICE_START_PENDING ; 0x5 ; The SERVICE_START_PENDING type means that the service has been sent a command to start, however, the command has not yet been executed. The DWORD value that this corresponds to is 0x00000002.
SERVICE_STOP_PENDING ; 0x6 ; The SERVICE_STOP_PENDING type means that the service has been sent a command to stop, however, the command has not yet been executed. The DWORD value that this corresponds to is 0x00000003.
SERVICE_STOPPED ; 0x7 ; The SERVICE_STOPPED type means that the service is stopped. The DWORD value that this corresponds to is 0x00000001.
; 0x8 ; The empty string value is permitted here to allow for empty elements associated with error conditions.
status: current
description: Specifies the current state of the service.

7.386. controlsAccepted
elementId: TBD
name: controlsAccepted
dataType: enumeration
structure: SERVICE_ACCEPT_NETBINDCHANGE ; 0x1 ; The SERVICE_ACCEPT_NETBINDCHANGE type means that the service is a network component and can accept changes in its binding without being stopped or restarted. The DWORD value that this corresponds to is 0x00000010.
SERVICE_ACCEPT_PARAMCHANGE ; 0x2 ; The SERVICE_ACCEPT_PARAMCHANGE type means that the service can re-read its
startup parameters without being stopped or restarted. The DWORD value that this corresponds to is 0x00000008.

SERVICE_ACCEPT_PAUSE_CONTINUE ; 0x3 ; The SERVICE_ACCEPT_PAUSE_CONTINUE type means that the service can be paused or continued. The DWORD value that this corresponds to is 0x00000002.

SERVICE_ACCEPT_PRESHUTDOWN ; 0x4 ; The SERVICE_ACCEPT_PRESHUTDOWN type means that the service can receive pre-shutdown notifications. The DWORD value that this corresponds to is 0x00000100.

SERVICE_ACCEPT_SHUTDOWN ; 0x5 ; The SERVICE_ACCEPT_SHUTDOWN type means that the service can receive shutdown notifications. The DWORD value that this corresponds to is 0x00000004.

SERVICE_ACCEPT_STOP ; 0x6 ; The SERVICE_ACCEPT_STOP type means that the service can be stopped. The DWORD value that this corresponds to is 0x00000001.

SERVICE_ACCEPT_HARDWAREPROFILECHANGE ; 0x7 ; The SERVICE_ACCEPT_HARDWAREPROFILECHANGE type means that the service can receive notifications when the system’s hardware profile changes. The DWORD value that this corresponds to is 0x00000020.

SERVICE_ACCEPT_POWEREVENT ; 0x8 ; The SERVICE_ACCEPT_POWEREVENT type means that the service can receive notifications when the system’s power status has changed. The DWORD value that this corresponds to is 0x00000040.

SERVICE_ACCEPT_SESSIONCHANGE ; 0x9 ; The SERVICE_ACCEPT_SESSIONCHANGE type means that the service can receive notifications when the system’s session status has changed. The DWORD value that this corresponds to is 0x00000080.

SERVICE_ACCEPT_TIMECHANGE ; 0xA ; The SERVICE_ACCEPT_TIMECHANGE type means that the service can receive notifications when the system time changes. The DWORD value that this corresponds to is 0x00000200.

SERVICE_ACCEPT_TRIGGEREVENT ; 0xB ; The SERVICE_ACCEPT_TRIGGEREVENT type means that the service can receive notifications when an event that the service has registered for occurs on the system. The DWORD value that this corresponds to is 0x00000400.

; 0xC ; The empty string value is permitted here to allow for empty elements associated with error conditions.

status: current

description: Specifies the control codes that a service will accept and process.
7.387. startName

   elementId: TBD
   name: startName
   dataType: string
   status: current
   description: Specifies the account under which the process should run.

7.388. serviceFlag

   elementId: TBD
   name: serviceFlag
   dataType: boolean
   status: current
   description: Specifies whether the service is in a system process that must always run (true) or if the service is in a non-system process or is not running (false).

7.389. dependencies

   elementId: TBD
   name: dependencies
   dataType: string
   status: current
   description: Specifies the dependencies of this service on other services.

7.390. serviceeffectiverights

   elementId: TBD
   name: serviceeffectiverights
   dataType: list
   structure: list (serviceName, trusteeSid, standardDelete, standardReadControl, standardWriteDac, standardWriteOwner, genericRead, genericWrite, genericExecute, serviceQueryConf, serviceChangeConf, serviceQueryStat, serviceEnumDependents, serviceStart, serviceStop, servicePause, serviceInterrogate, serviceUserDefined)
   status: current
   description: Stores the effective rights of a service that a discretionary access control list (DACL) structure grants to a specified trustee. The trustee’s effective rights are determined by checking all access-allowed and access-denied access control entries (ACEs) in the DACL.
7.391. trusteeSid

   elementId: TBD
   name: trusteeSid
   dataType: string
   status: current
   description: Specifies the SID that is associated with a user, group, system, or program (such as a Windows service).

7.392. serviceQueryConf

   elementId: TBD
   name: serviceQueryConf
   dataType: boolean
   status: current
   description: Specifies whether or not permission is granted to query the service configuration.

7.393. serviceChangeConf

   elementId: TBD
   name: serviceChangeConf
   dataType: boolean
   status: current
   description: Specifies whether or not permission is granted to change service configuration.

7.394. serviceQueryStat

   elementId: TBD
   name: serviceQueryStat
   dataType: boolean
   status: current
   description: Specifies whether or not permission is granted to query the service control manager about the status of the service.

7.395. serviceEnumDependents

   elementId: TBD
   name: serviceEnumDependents
   dataType: boolean
   status: current
   description: Specifies whether or not permission is granted to query for an enumeration of all the services dependent on the service.
7.396. serviceStart

elementId: TBD
name: serviceStart
dataType: boolean
status: current
description: Specifies whether or not permission is granted to start the service.

7.397. serviceStop

elementId: TBD
name: serviceStop
dataType: boolean
status: current
description: Specifies whether or not permission is granted to stop the service.

7.398. servicePause

elementId: TBD
name: servicePause
dataType: boolean
status: current
description: Specifies whether or not permission is granted to pause or continue the service.

7.399. serviceInterrogate

elementId: TBD
name: serviceInterrogate
dataType: boolean
status: current
description: Specifies whether or not permission is granted to request the service to report its status immediately.

7.400. serviceUserDefined

elementId: TBD
name: serviceUserDefined
dataType: boolean
status: current
description: Specifies whether or not permission is granted to specify a user-defined control code.
7.401.  sharedresourceauditedpermissions

elementId: TBD
name: sharedresourceauditedpermissions
dataType: list
structure: list (netname, trusteeSid,
standardDelete, standardReadControl, standardWriteDac,
standardWriteOwner, standardSynchronize,
accessSystemSecurity, genericRead, genericWrite,
genericExecute, genericAll)
status: current
description: Stores the audited access rights of a shared resource that a system access control list (SACL) structure grants to a specified trustee. The trustee’s audited access rights are determined checking all access control entries (ACEs) in the SACL.

7.402.  netname

elementId: TBD
name: netname
dataType: string
status: current
description: Specifies the name associated with a particular shared resource.

7.403.  sharedresourceeffectiverights

elementId: TBD
name: sharedresourceeffectiverights
dataType: list
structure: list (netname, trusteeSid,
standardDelete, standardReadControl, standardWriteDac,
standardWriteOwner, standardSynchronize,
accessSystemSecurity, genericRead, genericWrite,
genericExecute, genericAll)
status: current
description: Stores the effective rights of a shared resource that a discretionary access control list (DACL) structure grants to a specified trustee. The trustee’s effective rights are determined checking all access-allowed and access-denied access control entries (ACEs) in the DACL.
7.404. user

    elementId: TBD
    name: user
    dataType: list
    structure: list (username, enabled, group, lastLogon)
    status: current
    description: Specifies the groups to which a user belongs.

7.405. enabled

    elementId: TBD
    name: enabled
    dataType: boolean
    status: current
    description: Represents whether the particular user is enabled or not.

7.406. lastLogon

    elementId: TBD
    name: lastLogon
    dataType: unsigned32
    status: current
    description: The date and time when the last logon occurred.

7.407. groupSid

    elementId: TBD
    name: groupSid
    dataType: string
    status: current
    description: Represents the SID of a particular group. If the specified user belongs to more than one group, then multiple groupSid elements are applicable. If the specified user is not a member of a single group, then a single groupSid element should be included with a status of ‘does not exist’. If there is an error determining the groups that the user belongs to, then a single groupSid element should be included with a status of ‘error’.

8. Acknowledgements

    Many of the specifications in this document have been developed in a public-private partnership with vendors and end-users. The hard work
of the SCAP community is appreciated in advancing these efforts to their current level of adoption.

Over the course of developing the initial draft, Brant Cheikes, Matt Hansbury, Daniel Haynes, Scott Pope, Charles Schmidt, and Steve Venema have contributed text to many sections of this document.

9. IANA Considerations

This document specifies an initial set of Information Elements for SACM in Section 7. An Internet Assigned Numbers Authority (IANA) registry will be created and populated with the Information Elements in Section 7. New assignments for SACM Information Elements will be administered by IANA through Expert Review [RFC2434]. The designated experts MUST check the requested Information Elements for completeness and accuracy of the submission with respect to the template and requirements expressed in Section 4 and Section 4.1. Requests for Information Elements that duplicate the functionality of existing Information Elements SHOULD be declined. The smallest available Information Element identifier SHOULD be assigned to a new Information Element. The definition of new Information Elements MUST be published using a well-established and persistent publication medium.

10. Security Considerations

Posture Assessments need to be performed in a safe and secure manner. In that regard, there are multiple aspects of security that apply to the communications between components as well as the capabilities themselves. This information model only contains an initial listing of items that need to be considered with respect to security and will need to be augmented as the model continues to be developed.

Security considerations include:

Authentication: Every SACM Component and asset needs to be able to identify itself and verify the identity of other SACM Components and assets.

Confidentiality: Communications between SACM Components need to be protected from eavesdropping or unauthorized collection. Some communications between SACM Components and assets may need to be protected as well.

Integrity: The information exchanged between SACM Components needs to be protected from modification. Some exchanges between assets and SACM Components will also have this requirement.
Restricted Access: Access to the information collected, evaluated, reported, and stored should only be viewable and consumable to authenticated and authorized entities.

Considerations with respect to the operational aspects of collection, evaluation, and storage security automation information can be found in Section 11.

Considerations concerning the privacy of security automation information can be found in Section 12.

11. Operational Considerations

The following sections outline a series of operational considerations for SACM deployments within an organization. This section may be expanded to include other considerations as the WG gains additional operational experience with SACM deployments and extending the information model.

11.1. Endpoint Designation

In order to successfully carry out endpoint posture assessment, it is necessary to be able to identify the endpoints on a network and track the changes to them over time. Specifically, enabling SACM Components to:

- Tell whether two endpoint attribute assertions concern the same endpoint
- Respond to compliance measurements, for example by reporting, remediating, and quarantining (SACM does not specify these responses, but SACM exists to enable them).

Ideally, every endpoint would be identified by a unique identifier present on the endpoint, but, this is complicated due to different factors such as the variety of endpoints on a network, the ability of tools to reliably access such an identifier, and the ability of tools to correlate disparate identifiers. As a result, it is necessary for an endpoint to be identified by a set of attributes that uniquely identify it on a network. The set of attributes that uniquely identify an endpoint on a network will likely vary by organization; however, there are a number of properties to consider when selecting identifying attributes as some are better suited for identification purposes than others.

Multiplicity: Is the attribute typically associated with a single endpoint or with multiple endpoints? If the attribute is
associated with a single endpoint, it is better for identifying an endpoint on a network.

Persistence: How likely is the attribute to change? Does it never change? Does it only change when the endpoint is reprovisioned? Does it only change due to an event? Does it change on an ad-hoc and often unpredictable basis? Does it constantly change? The less likely it is for an attribute to change over time, the better it is for identifying an endpoint on a network.

Immutability: How difficult is it to change the attribute? Is the attribute hardware rooted and never changes? Can the attribute be changed by a user/process with the appropriate access? Can the attribute be changed without controlled access. The less likely an attribute is to change over time, the better chance it will be usable to identify an endpoint over time.

Verifiable: Can the attribute be corroborated? Can the attribute be externally verified with source authentication? Can the attribute be externally verified without source authentication? Is it impossible to externally verify the attribute. Attributes that can be externally verified are more likely to be accurate and are better for identifying endpoints on a network.

With that said, requiring SACM Components and end users to constantly refer to a set of attributes to identify an endpoint, is particularly burdensome. As a result, SACM supports the concept of a target endpoint label which associates an identifier (unique to a SACM domain) with the set of attributes used by an organization to identify endpoints on a network. Once defined for an endpoint, the target endpoint label can be used in place of the set of identifying attributes.

11.2. Timestamp Accuracy

An organization will likely have different collectors deployed across the network that will be configured to collect posture attributes on varying frequencies (periodic, ad-hoc, event-driven, on endpoint, off endpoint, etc.). Some collectors will detect changes as soon as they occur whereas others will detect them at a later point during a periodic scan or when an event has triggered the collection of posture attributes. Furthermore, some changes will be detected on the endpoint and others will be observed off of the endpoint. As a result of these differences, the accuracy of the timestamp associated with the collected information will vary. For example, if a
collector is only running once every 12 hours, the change probably happened at some point in time prior to the scan and the timestamp is likely not accurate. Due to this, it is important for system administrators to determine if the accuracy of a timestamp is good enough for their intended purposes.

12. Privacy Considerations

In the IETF, there are privacy concerns with respect to endpoint identity and monitoring. This is especially true when the activity on an endpoint can be linked to a particular person. For example, by correlating endpoint attributes such as usernames, certificates, etc. with browser activity, it may be possible to gain insight into user behavior and trends beyond what is required to carry out endpoint posture assessments. In the hands of the wrong person, this information could be used to negatively influence a user’s behavior or to plan attacks against the organization’s infrastructure.

As a result, SACM data models should incorporate a mechanism by which an organization can designate which endpoint attributes are considered sensitive with respect to privacy. This will allow SACM Components to handle endpoint attributes in a manner consistent with the organization’s privacy policies. Furthermore, organization’s should put the proper mechanism in place to ensure endpoint attributes are protected when transmitted, stored, and accessed to ensure only authorized parties are granted access.

It should also be noted that some of this is often mitigated by organizational policies that require a user of an organization’s network to consent to some level of monitoring in return for access to the network and other resources. The information that is monitored and collected will vary by organization and further highlights the need for a mechanism by which an organization can specify what constitutes privacy sensitive information for them.

[I-D.ietf-sacm-terminology]

Appendix A. Change Log
A.1. Changes in Revision 01

Added some proposed normative text.

For provenance:

Added a class "Method"

Added the produced-using relationship between an AVP and a method

Added the produced-by relationship between a Guidance and a SACM Component

Added the hosted-by relationship between a SACM Component and an Endpoint

asserted-by and summarized-by have been renamed to produced-by.

"User" is now "Account". If a user has different credentials, SACM cannot know that they belong to the same user. But, per Kim W, many organizations do have accounts that associate credentials.

The multiplicity of the based-on relationships has been corrected.

More relationships now have labels, per UML convention.

The diagram no longer has causal arrow. They had become redundant and were nonstandard and clutter.

Renamed "credential" to "identity", following industry usage. A credential includes proof, such as a key or password. A username or a distinguished name is called an "identity".

Removed Session, because an endpoint’s network activity is not SACM’s initial focus

Removed Authorization, for the same reason

Added many-to-many relationship between Hardware Component and Endpoint, for clarity

Added many-to-many relationship between Software Component and Endpoint, for clarity

Added "contains" relationship between Network Interface and Network Interface
Removed relationship between Network Interface and Account. The endpoint knows the identity it used to gain network access. The PDP also knows that. But they probably do not know the account.

Added relationship between Network Interface and Identity. The endpoint and the PDP will typically know the identity.

Made identity-to-account a many-to-one relationship.

A.2. Changes in Revision 02

Added Section Identifying Attributes.

Split the figure into Figure Model of Endpoint and Figure Information Elements.

Added Figure Information Elements Take 2, proposing a triple-store model.

Some editorial cleanup

A.3. Changes in Revision 03

Moved Appendix A.1, Appendix A.2, and Mapping to SACM Use Cases into the Appendix. Added a reference to it in Section 1

Added the Section 4 section. Provided notes for the type of information we need to add in this section.

Added the Section 6 section. Moved sections on Endpoint, Hardware Component, Software Component, Hardware Instance, and Software Instance there. Provided notes for the type of information we need to add in this section.

Removed the Provenance of Information Section. SACM is not going to solve provenance rather give organizations enough information to figure it out.

Updated references to the Endpoint Security Posture Assessment: Enterprise Use Cases document to reflect that it was published as an RFC.

Fixed the formatting of a few figures.

Included references to [RFC3580] where RADIUS is mentioned.
A.4. Changes in Revision 04

Integrated the IPFIX [RFC7012] syntax into Section 4.

Converted many of the existing SACM Information Elements to the IPFIX syntax.

Included existing IPFIX Information Elements and datatypes that could likely be reused for SACM in Section 7 and Section 4 respectively.

Removed the sections related to reports as described in https://github.com/sacmwg/draft-ietf-sacm-information-model/issues/30.

Cleaned up other text throughout the document.

A.5. Changes in Revision 05

Merged proposed changes from the I-D IM into the WG IM (https://github.com/sacmwg/draft-ietf-sacm-information-model/issues/41).

Fixed some formatting warnings.

Removed a duplicate IE and added a few IE datatypes that were missing.

A.6. Changes in Revision 06

Clarified that the SACM statement and content-element subjects are conceptual and that they do not need to be explicitly defined in a data model as long as the necessary information is provided.

Updated the IPFIX syntax used to define Information Elements. There are still a couple of open issues that need to be resolved.

Updated some of the Information Elements contained in Section 7 to use the revised IPFIX syntax. The rest of the Information Elements will be converted in a later revision.

Performed various clean-up and refactoring in Sections 6 and 7. Still need to go through Section 8.

Removed appendices that were not referenced in the body of the draft. The text from them is still available in previous revisions of this document if needed.
A.7. Changes in Revision 07

Made various changes to the IPFIX syntax based on discussions at the IETF 96 Meeting. Changes included the addition of a structure property to the IE specification template, the creation of an enumeration datatype, and the specification of an IE naming convention.

Provided text to define Collection Guidance, Evaluation Guidance, Classification Guidance, Storage Guidance, and Evaluation Results.

Included additional IEs related to software, configuration, and the vulnerability assessment scenario.

Added text for the IANA considerations, security considerations, operational considerations, and privacy considerations sections.

Performed various other editorial changes and clean-up.

A.8. Changes in Revision 08

Clarified text that describes subjects and attributes.

Clarified text that describes SACM Statements and Content Elements.

Removed stray metadata property fields from the definitions of several IEs.

Specified a syntax for defining category IEs.

Added an anyCategory IE that represents any IE in the IM.

Fixed several errors reported by the Travis-CI continuous integration service.

Performed various other editorial changes and clean-up.

A.9. Changes in Revision 09

Added "derived", "authority", and "verified" to the collectionTaskType IE (https://github.com/sacmwg/draft-ietf-sacm-information-model/issues/18).

Updated IE examples that use content-type to use statement-type (https://github.com/sacmwg/draft-ietf-sacm-information-model/issues/56).
Added "networkZoneLocation", "layer2NetworkLocation", and "layer3NetworkLocation" IEs (https://github.com/sacmwg/draft-ietf-sacm-information-model/issues/9).

Created a softwareClass attribute IE and added it to the softwareInstance subject IE. Also, removed the os* attribute IEs (https://github.com/sacmwg/draft-ietf-sacm-information-model/issues/10).
