Media subtype registration for media type text/troff
draft-lilly-text-troff-00

Status of this Memo

This document is an Internet-Draft and is subject to all provisions of section 3 of RFC 3667. By submitting this Internet-Draft, the author represents that any applicable patent or other IPR claims of which he is aware have been or will be disclosed, and any of which he become aware will be disclosed, in accordance with RFC 3668.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

Abstract

A text media subtype for tagging content consisting of juxtaposed text and formatting directives as used by the troff series of programs and for conveying information about the intended processing steps necessary to produce formatted output is described.

1. Introduction

It is sometimes desirable to format text in a particular way for presentation. One approach is to provide formatting directives in juxtaposition to the text to be formatted. That approach permits reading the text in unformatted form (by ignoring the formatting directives), and it permits relatively simple repurposing of the text for different media by making suitable alterations to the formatting directives or the environment in which they operate. One particular
series of related programs for formatting text in accordance with that model is often referred to generically as "troff", although that is also the name of a particular lineage of programs within that generic category for formatting text specifically for typesetter and typesetter-like devices. A related formatting program within the generic "troff" category, usually used for character-based output such as (formatted) plain text is known as "nroff". For the purpose of the media type defined here, the entire category will be referred to simply by the generic "troff" name. Troff as a distinct set of programs first appeared in the early 1970s [CSTR54], based on the same formatting approach used by some earlier programs ("runoff" and "roff"). It has been used to produce documents in various formats, ranging in length from short memoranda to books (including tables, diagrams, and other non-textual content). It remains in wide use as of the date of this document; this document itself was prepared using the troff family of tools per [RFC2223].

The basic format (juxtaposed text and formatting directives) is extensible and has been used for related formatting of text and graphical document content. Formatting is usually controlled by a set of macros; a macro package is a set of related formatting tools, written in troff format (although compressed binary representations have also been used) and using basic formatting directives to extend and manage formatting capabilities for document authors. There are a number of preprocessors which transform a textual description of some content into the juxtaposed text and formatting directives necessary to produce some desired output. Preprocessors exist for formatting of tables of text and non-textual material, mathematical equations, chemical formulae, general line drawings, graphical representation of data (in plotted coordinate graphs, bar charts, etc.), representations of data formats, and representations of the abstract mathematical construct known as a graph (consisting of nodes and edges). Many such preprocessors use the same general type of input format as the formatters, and such input is explicitly within the scope of the media type described in this document.

2. Requirement Levels

The key words "MUST", "SHOULD", "SHOULD NOT", "RECOMMENDED", and "MAY" in this document are to be interpreted as described in [RFC2119].

3. Scope of Specification

The described media type refers to input which may be processed by preprocessors and by a page formatter. It is intended to be used where content has some text which may be comprehensible (either as text per se or as a readable description of non-text content) without machine processing of the content. Where there is little or no comprehensible text content, this media type SHOULD NOT be used. For
example, while output of the pic preprocessor is certainly troff-compatible sequences of formatting directives, the sheer number of individual directives interspersed with any text that might be present makes comprehension difficult, whereas the preprocessor input language (as described in the Published Specification section of the registration below) may provide a concise and comprehensible description of graphical content. Preprocessor output which includes a large proportion of formatting directives would best be labeled as a subtype of the application media type. If particular preprocessor input content describes only graphical content with little or no text, and which is not readily comprehensible from a textual description of the graphical elements, a subtype of the image media type would be appropriate. The purpose of labeling media content is to provide information about that content to facilitate use of the content. Use of a particular label requires some common sense and judgment, and SHOULD NOT be mechanically applied to content in the absence of such judgment.

4. Registration Template

Type name:
text

Subtype name:
troff

Required parameters:
none

Optional parameters:

charset
Must be a charset registered for use with MIME text types [RFC2046], except where transport protocols are explicitly exempted from that restriction. Specifies the charset of the media content. With traditional source content, this will be the default "US-ASCII" charset. Some recent versions of troff processing software can handle Unicode input charsets, however there may be interoperability issues if the input uses such a charset (see Interoperability considerations below).

process
Lists a recommended command pipeline for formatting. The parameter value may need to be quoted or encoded as provided for by [RFC2045] as amended by [RFC2231] and [errata].

resources
Lists any required additional files or programs that are required for formatting (e.g. via .cf, .nx, .pi, .so, and/or .sy directives).
versions

Human-readable indication of any known specific versions of
preprocessors, formatter, macro packages, postprocessors, etc.
required to process the content.

Encoding considerations:

7bit is adequate for traditional troff provided line endings are
canonicalized per [RFC2046]. Transfer of this media type content
via some transport mechanisms may require or benefit from encoding
into a 7bit range via a suitable encoding method such as the ones
described in [RFC2045].

8bit may be used with Unicode characters represented as a series
of octets using the utf-8 charset [RFC3629], where transport
methods permit 8bit content and where content line length is
suitable.

Binary may be necessary when raw Unicode is used or where line
lengths exceed the allowable maximum for 7bit and 8bit content
[RFC2045], and may be used in environments (e.g. HTTP [RFC2616])
where Unicode characters may be transferred via a non-MIME charset
such as UTF-16 [RFC2781].

Restrictions on usage:
none

Security considerations:

Some troff directives (.sy and .pi) can cause arbitrary external
programs to be run. Several troff directives (.so, .nx, and .cf)
may read external files (and/or devices on systems which support
device input via file system semantics) during processing.
Several preprocessors have similar features. Some implementations
have a "safe" mode which disables some of these features. Users
of this media type should be vigilant of the potential for damage
which may be caused by careless processing of media obtained from
untrusted sources.

Processing of this media type other than by facilities which strip
or ignore potentially dangerous directives, and processing by
preprocessors and/or postprocessors should not be invoked
automatically (i.e. w/o user confirmation).

A command line, such as may be suggested via the optional
"process" parameter, is a powerful tool when used by a
computer-literate person. Individuals lacking basic security
knowledge and/or common sense should not be given unsupervised
access to a command line. Users of this media type should
carefully examine the suggested command pipeline and media content
before executing commands.

Interoperability considerations:

Recent implementations of formatters, macro packages, and preprocessors may include some extended capabilities which are not present in earlier implementations. Use of such extensions obviously limits the ability to produce consistent formatted output at sites with implementations that do not support those extensions. Use of any such extensions in a particular document using this media type SHOULD be indicated via the "versions" parameter value.

As mentioned in the Introduction, macro packages are troff documents, and their content may be subject to copyright. That has led to multiple independent implementations of macro packages, which may exhibit gross or subtle differences with some content.

Some preprocessors or postprocessors might be unavailable at some sites. Where some implementation is available, there may be differences in implementation that affect the output produced. For example, some version of the "pic" preprocessor provide the capability to fill a bounded graphical object; others lack that capability. Of those that support that feature, there are differences in whether a solid fill is represented by a value of 0.0 vs. 1.0. Some implementations support only gray-scale output; others support color.

Preprocessors or postprocessors may depend on additional programs such as awk, and implementation differences (including bugs) may lead to different results on different systems (or even on the same system with a different environment).

There is a wide variation in the capabilities of various presentation media and the devices used to prepare content for presentation. Indeed, that is one reason that there are two basic formatter program types (nroff for output where limited formatting control is available, and troff where a greater range of control is possible). Clearly, a document which is designed to use complex or sophisticated formatting might not be representable in simpler media or with devices lacking certain capabilities. Often it is possible to produce a somewhat inferior approximation; colors might be represented as gray-scale values, accented characters might be produced by overstriking, italics might be represented by underlining, etc.

Various systems store text with different line ending codings. For the purpose of transferring this media type between systems or between applications using MIME methods, line endings MUST use the canonical CRLF line ending per [RFC2046].
Published specification:
[CSTR54]

Applications which use this media type:

Preprocessors
tbl [CSTR49], grap [CSTR114], pic [CSTR116], chem [CSTR122],
eqn [eqn], dformat [CSTR142]

Formatters
troff, nroff, Eroff, sqtroff, groff, awf, cawf

Format converters
deroff, troffcvt, unroff, troff2html, mm2html

Macro packages
man [UNIXman1], me [me], mm [DWBguide], ms [ms], mv [DWBguide]

Additional information:

Magic number(s):
None, however the content format is distinctive (see Published specification).

File extension(s):
Files do not require any specific "extension". Many are in use as a convenience for mechanized processing of files, some associated with specific macro packages or preprocessors; others are ad-hoc. File names are orthogonal to the nature of the content. In particular, while a file name or a component of a name may be useful in some types of automated processing of files, the name or component might not be capable of indicating subtleties such as proportion of textual (as opposed to image or formatting directive) content. This media type should not be assigned a relationship with any file "extension" where content may be untrusted unless there is provision for human judgment which may be used to override that relationship for individual files. Where appropriate, a filename MAY be suggested by a suitable mechanism such as the one specified in [RFC2183].

Macintosh File Type Code(s):
unknown

Intended usage:
COMMON
5. Acknowledgments

The author would like to acknowledge the helpful comments provided by members of the ietf-types mailing list.

6. Security Considerations

Security considerations are discussed in the media registration. Additional considerations may apply in some contexts (e.g. MIME [RFC2049]).

7. Internationalization Considerations

The optional charset parameter may be used to indicate the charset of the media type content. In some cases, that content’s charset might be carried through processing for display of text. In other cases, combinations of octets in particular sequences are used to represent glyphs which cannot be directly represented in the content charset. In either of those categories, the language(s) of the text might not be evident from the character content, and it is RECOMMENDED that a suitable mechanism (e.g. [RFC3066]) be used to convey text language where such a mechanism is available. Where multiple languages are used within a single document, it may be necessary or desirable to indicate the languages to readers directly via explicit indication of language in the content. In still other cases, the media type content (while readable and comprehensible in text form) represents symbolic or graphical information such as mathematical equations or chemical formulae, which are largely global and language-independent.

8. IANA Considerations

IANA shall enter and maintain the registration information in the media type registry as directed by the IESG.
Appendix A. Example

The input:

```
Content-Type: text/ troff :
    process="GROFF_NO_SGR=1 dformat | pic -n | troff -ms"
```

Here’s what an IP packet header looks like:

```
.begin dformat
    style fill off
    style bitwid 0.20
    style recspread 0
    style recht 0.34
    noname
    0-3 Version
    4-7 IHL
    8-15 Type of Service
    16-31 Total Length
    noname
    0-15 Identification
    16-18 Flags
    19-31 Fragment Offset
    noname
    0-7 Time to Live
    8-15 Protocol
    16-31 Header Checksum
    noname
    0-31 Source Address
    noname
    0-31 Destination Address
    noname
    0-23 Options
    24-31 Padding
.end
```
produces as output:

Here's what an IP packet header looks like:

<table>
<thead>
<tr>
<th>Version</th>
<th>IHL</th>
<th>Type of Service</th>
<th>Total Length</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Identification</th>
<th>Flags</th>
<th>Fragment Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Time to Live</th>
<th>Protocol</th>
<th>Header Checksum</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Source Address</th>
<th>Destination Address</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Options</th>
<th>Padding</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
